	Originally posted by Michael458: Now, please RIP, Jim, IBT, Boom, Glenn really, am I just being too simple with this twist thing? What am I missing? I mean honestly I really could be, it's all about stability to me, and makes good common sense to me, but I don't know anything about twist rates, hell I don't even know half the twist rates of my rifles for sure! I know the 500s! And after TWO SHOTS I made a decision to CHANGE EVERY SINGLE .500 made to 1:12 twist rates, and I promise that is not one rifle, but many rifles! All based on TWO SHOTSNOT ONE. Pretty damn easy to see if you ask me!	
	Michael,	
	I've drafted a couple of fairly lengthy responses to this question, but I'll suffice it to say this, "Mo FN and expanding brass and copper bullets are changing perceptions that have existed for more 100 years. One either approaches this with an open or closed mind. I approach your efforts with open mind and hope that you don't let the closed minded individuals interrupt your efforts.	than
	Myself, I could care less what scientific equation proves or disproves the impact of twist rate to b performance in your test mix in your laboratory environment or in your follow-up test against gan animals in a hunting environment.	
	If it works, it worksthat's what I care abouteven if the equation says it doesn't.	
	Keep the faith, keep up the good work. Take a few days off to rest and then give us some more stuff!	good

	My take is that the eggheads do not understand everything about twist and penetration Not magic, just the way it is. I better build a $1:10^\circ$ twist 458 B&M	1.
	and compare that to a 1:20" 45-70. Should be even more better.	
	Rip, I totally understand. Reminds me of an argument I had about 10 years ago with 5 individuals a having degrees relating to statistics. Me, I don't.	II
	Argument related to this:	
	The statisticians including their immediate supervisor were adamant in their stance that the wo office had performed over a nine month period was not statistically valid because we had not u	
	the recognized sampling methodology from which to draw our conclusions. And further more th could not claim that our conclusions had a 100% confidence level.	
	My stance, I didn't care what they said. I'd directed my office to review 100% of the cases ther our conclusions had a 100% confidence level regardless of whether we'd utilized a statistically	
	sampling methodology or not. It took their lead contracting officer to get involved to finally admit that yes, since we'd perform	
	100% sampling rather than their 3% statistical sampling that they'd have to agree that our find were 100% accurate.	
	The statisticians couldn't see the results beyond the process. Myself, I was only interested in the results regardless of the process efforts. $\textcircled{0}$	he
	Statistical data methodology and sampling size; I'll leave it up to Michael as to whether he war	
	expend the time, effort, gunpowder, bullets, primers, and most especially the paper products n fire a 10 shot sampling each of the 400gr Barnes Buster from his $14''$ twist rate 458 B&M barrel	
	and his 20" twist rate 45/70 barreled rifle. In the meantime, I'll accept Michael's efforts for what they've already demonstrated; .458 calib	or 14"
	twist is better than .458 caliber 20" twist rate barrel for straight-line penetration results with a identical bullet and virtually identical muzzle velocity.	
	And yes I also agree, a $10''$ twist rate will be much better than the $14''$ twist rate and I'll completion ignore the $20''$ twist rate.	etely

Hey Boys, got a couple of new "lurkers" to venture out!

Hi Guys!

Good to have you! Thanks for joining in.

Glenn

Well just damn the torpedos full speed ahead!

Michael states that in his small bit of experience with twist rates He says that a faster twist does in fact "STABILIZE" the bullet during terminal penetration!

Anything else I would say would be a lie, can't do that? The above is a true statement to the best of my knowledge and experience.

Time of course will prove this out, not theory, not to me, simple fact. While if conducting true "scientific" tests, yes, we would need to shoot many more bullets, 10 each as RIP suggests, probably being about right.....Very true.

However, please keep in mind, we are skimming the surface of MANY aspects of terminal performance, not one or two, perhaps 100s before it is done! Look at the ground covered in only a few weeks? This, is yet another aspect we are looking at, skimming over. Now as we move along, time will to sort this out. I have experience with the .500s and now todays little 458 tests with different twists and so far the faster twist rate is holding out. The end.

I don't have a horse in this race. I could give a crap about twist rates as long as I get what I want, straight deep penetration. It seems to me, the faster that twist rate is, that's what gets me to where I need to be.

Alf, I don't care about wound ballistics, that is not the issue, and to be quite frank with you, probably most of the wound ballistics you may be speaking of are not pertaining to what we are doing anyway. Most of what you may be speaking of is handgun, military type projectiles and really has little to do with Big Bore rifles and solid flat nose or round nose projectiles. Do you have material done on wound ballistics directly related to Big Bore rifle projectiles, flat nose or round nose profiles? .308 caliber does not qualify, nor does spitzer profile bullets, and BC has no home here either. Handgun wound ballistics is useless here in this discussion. I personally have no knowledge of anything that would "DIRECTLY" relate to what is being done here, or even discussed? Of course, the "FOUNTAIN OF ALL KNOWLEDGE" does not flow from my lips alone. Just that I have no knowledge or have never seen any "wound ballistics" that would relate to this arena of "big bore" rifles? Certainly I would like to see such?

Now, please. Remember when I started this discussion, might want to go back and read the very first post again!

If I really had to prove twist rate, without doubt, shoot 10 each in the 45/70 and the 458 B&M. I know the outcome already, I know what I do here. The problem is this, I have many many many other things that I can spend my time on proper with other bullets that need much more than proving a point about twist rates. Think of how much paper and time I chew up doing that, the outcome being the same time after time. This would be a tremendous waste of assets that can be used in other areas of greater import!

465HH, While your opinions are extremely important and very valuable not only to me, and to everyone here, do keep in mind this, I am not trying to sell anything, I am not doing a book, nor an article, nor published anything in anyway. I state nothing except what I see and do, I do this for myself, my own satisfaction. My test medium has been standardized since 2005, and results are pretty damn close from test to test. Of course there are anomalies from time to time, but I have shot enough to recognize those. It is a tremendous undertaking just doing it the way I am, I have a ton of chewed up print right now, has to go out. I am trying to cover as much ground as possible, and do a lot of things. I can't really see getting tied up on any one thing over and over, especially knowing the outcome, and using that time elsewhere on something more important.

If my goal was to prove twist rates, then by god I would prove it, but it's not really worth all the effort. As far as I am concerned it's a moot point. It's proven. And for gods sake, it's about stability, seems to me any one with two cents worth of noggin could get that, without having to prove it "Scientifically" by testing, over and over? Yes, it would be best to shoot say 10 samples each. But guess what, even with all that effort, that work, that time, there would be someone that would say, "This is no good, you must shoot 20 bullets each".

I can load and shoot 100 round nose woodleighs 416-458-470-510 caliber, and in this medium they are going to veer off course time after time after time until the end of time! I never seen one not! Same with the old Barnes round nose. It's a fact, like it or not, work in the field or not, this is the way it is and will always be, in this medium!

Faster twist rates in every test with solids I have done, mostly in .500 caliber looking for straight penetration, faster twist rates have given straighter deeper penetration. Why would I change the twist rate from 1:18 to 1:12 on the .500s? Not talking about 1 or two rifles here!

Now to begin with, would someone tell me exactly what the hell the issue is??? Is there some kind of "Devotion to a twist rate"? Does it piss someone off because I tread on "their own personal twist rate"? I am lost, I don't get it? Who cares? I don't, long as it works!

For all those who want me to PROVE something, and really want me to shoot 10-20-or a 100 in a test, I will by god do it!!!!!!! But you can pack your damn bags, and get out of your damn lazy ass chair, and you can come help me do it! I will do the shooting, and you can deal with the chewed up mess I leave behind! And until there is something "WORTH" proving, then forget about it!

Like dealing with my damn kids or something!

Michael

One of Us Michael, Well your post, or posts I should say, eliminated the diatribe I was ready to spew forth. Thanks. Twist rate? Thanks for running the 14" vs. 20" twist rate with the 400gr Barnes Buster for me. Yes I raised that ugly head; but sure didn't know it'd step on so many sensitive toes out there. Me, I agree with Rip, if a 14" twist rate was better than a 20" twist rate then a 10" twist rate must be even better in the .458 caliber! Yep, I agree with that opinion regardless of scientific equations proving otherwise. Keep the faith, keep up the good work! And don't freeze you yahoo off when the storm hits this weekend! Jim ?  Does this mean you are not going to calibrate each new batch of test media by shooting it with a BB gun? Could calibrate with a space may be a provided of the start something too? You are not going to believe this! I don't have a BB gun? Could calibrate with a space maybe? Throwing stars? I don't want a pellet gun neither! Could calibrate with a spear maybe? Throwing stars? I don't have those either! I know! My Samurai Sword! That would do, but I am a little scared of it! Swear, good story, try to be short. I can laugh at myself, but my god I am glad there is no video of this! Ok, all my life, wanted a real Samurai Sword! A few years ago my lovely (young) wife found one for my birthday! Real deal, very nice, pretty good condition too. Blade needed some sharpening and polishing, but it was mostly in excellent condition. I have a buddy, same one that cuts my brass for me, he's good with this sort of thing, so he cleaned, sharpende, polished, got I thaptill! So he brought it to me and we rubbed it a bit, he left, I am alone in the building here ok. So I am gracting my "Samura! Moves" (I saw it on to vk) and I am looking pretty good, back and forth, that big blade siling through the airl OK, got the picture? All the subden I feel this wetness above my ankle, I look down and sure enough I had cut my fool self with this thing I was pouring the blood everywhere. Damn thing was so sharp I did not even feel it! Well, Cleaned everything up, made sure no one was around, and put that deady dangerous thing way before I really hurt myself, or someone else! It was hilarious. I really am pleased no one actually saw this! While it might be good to calibrate with, I think it's safer if it stays on top of the shelf, locked away in the gun lab! Mule the deady dangerous thing away before I really hurt myself, or someone else! It was hilarious, I really am pleased no one actually saw this! Mule it might be good to calibrate with, I think it's s	 bees this mean you are not going to calibrate seach new batch of test media by shooting it with a BB gun? C Now you gonna start something too? You are not going to believe this! I don't have a BB gun! C And from the looks of that scope on the gamo thing, I don't want a pellet gun neither! Could calibrate with a spear maybe? Throwing stars? I don't have those either! I know! My Samurai Sword! That would do, but I am a little scared of it! Swear, good story, try to be short. I can laugh at myself, but my god I am glad there is no video of this! Ok, all my life, wanted a real Samurai Sword! A few years ago my lovely (young) wife found one for my birkhday! Real deal, very nice, pretty good condition too. Blade needed some sharpening and polishing, but it was mostly in excellent condition. I have a buddy, same one that cuts my brass for me, he's good with this sort of thing, so he cleaned, sharpende, polished, got it right!!! So he brought it to me and we rubbed it a bit, he left, I am alme in the building here ok. So I an gracting my "Samurai Moves" (I saw it on tv ok) and I am looking pretty good, back and forth, that big blade silking through the airl OK, got the picture? All the sudden 1 feel this wetness abure on weas around, and put that deadly dangerous thing way before I really hurt myself, or someone else! It was hilarious, I really am pleased no one actually saw this! While it might be good to calibrate with, I think it's safer if it stays on top of the shelf, locked away in the gun lab! Mule the Box of "Conventional", add "Conventional" to the Endangered Species List! Live Outside The Box of "Conventional Wisdom" I do Not Own Any Part of Any Bullet Company, I am not in the Employ Of Any Bullet Company. I do not represent, own stock, one of I receive any proceeds, or monies from ANY BULLET COMPANY. I am not in the bullet builts to sell to you, nor anyone else. 	W.F.					
by shooting it with a BB gun? Solution is the provided it with a BB gun? The provided it with a BB gun? The provided it with a BB gun? Solution is the provided it with a spear maybe? You are not going to believe this! I don't have a BB gun! The provided it with a spear maybe? Throwing stars? I don't want a pellet gun neither! Could calibrate with a spear maybe? Throwing stars? 	quote:	
B A	And what do you get when you multiply rpms and torque? You get horsepower!	
	Actually, that's not horsepower. To get horsepower, you have to divide rpms times torque by 52. Sorry, I was just giddy with the excitement of discovery. Actually, there's not much rotational horsepower to a bullet. If you take the example of the 510 g .500 inch bullet, the "torque" would only be about .003 ft-lbs. The rpms would be 129,000 rpms bullet of about 2150 fps. Multiplying and dividing, the "horsepower" would be at most .075. (I've estimated the horsepower of a bullet and I may have miscalculated.) So not much to get excited about there.	grain for a

E A	HP = (Disp x Bmep x RPM)/396,000	
	Hi, Macifej!	
	Believe it or not, the formula that I gave and this formula intertwine so that they are exactly the thing. (I could show you if you're interested, but not in here.) But I'm not certain how to apply th bullet, other than what I said. Since a bullet is roughly a cylinder, I could use the bullet length. However, the bullet length is implied by the twist rate, which I've already used.	
	Anyway, other than the rpms, the quantities involved are too small for a bullet to make much horsepower, rotation wise. At least that I can see.	
	However, if you use the sectional density (in pounds per square inch) as the bmep (brake mean effective pressure), and the displacement (bullet area times bullet length, giving cubic inches), something interesting happens. The bullet cross-sectional areas cancel out and you are left only the bullet length times the bullet mass and the rpms, divided by 396,000. But the length (in feet) the mass (in pounds) would be so small that the "horsepower" developed would still be miniscul load applied (resisting force of the target) would effectively "stall" the rotation of the bullet. However, this does not necessarily negate the importance of the twist rate, since the twist rate implies bullet length. It could be bullet length that is the main concern, rather than the twist rate Food for thought, anyway.) and e. The

I guess my feeling is that you have an oppurtunity to prove one or more of the points of contention here to a standard that cannot be argued against based on scientific principles. Seems like a lost oppurtunity not to.

465H&H

465HH

I was hoping to fool you into a visit! Even if I supply the Sake? No I understand totally and completely of how to spend the budget with the most bang!

Oh my, that part about proving the point, that's some really good psychology you are using on me! You are playing me like a fiddle my man! My big question is this, Do you really and truly believe if I do this that it cannot be argued against? I am very seriously considering biting the bullet (pun intended) on this one! But will it actually prove it beyond all doubt? Or is there an alibi waiting for me after I do all the work involved?

How many bullets each for the 45/70 and the 458 B&M--same velocity same bullet (400 Barnes Buster of course). 5? 10? 6? Each. What if I do 5 and the results are the same each time or close?

IBT

Excellent point! Good info!

Michael

RIP	Disted 31 January 2010 11:35	Hide Post			
RIP one of us	posted 31 January 2010 11:35 Hide Post Hide Post lichael, uncan MacPherson bemoaned a 5-shot string with one test as not inspiring confidence. e seemed to prefer 10 data points much better. orry to say, I know what a bunch of work your testing is. o really analyze the data for predictive value, or confidence interval, you need the means of the two alues, variance, standard deviation, blah, blah. may have aced statistics courses over 30 years ago (engineering and business courses at U.K. and .S.U.) but I have forgotten most of it and would fall asleep trying to look up the tables and formulae. laybe Alf will come back for help with that. gotta build a .458 B&M, with 10" twist, and try to do 10 shots of 10" twist with that, and 10 shots of 0" twist with my 45/70, both with 400-grain Barnes Busters around 2000 fps in wet print. figure to squeeze in 6" of newspaper and 2" of glossy magazine (JAMA, Journal of the American ledical Association, finally useful), 8" compartments, waterlogged, times 10 in a train. hen analyze the data. herers a builet Expansion Analysis and Testing: ffect of Sectional Density An increase in initial (undeformed) bullet sectional density will cause equivalent expansion at lower elocity. Graeter expansion cours at the same velocity because the decelerating forces must act for a arger time interval to reduce the bullet velocity (the decelerating force and the stagnation pressure ausing deformation are highly correlated). This effect can also be quantified analytically in principle, ut is complex because equal builet distortion requires an equal force integral over time. he relationship between distored bullet surface position and time is difficult to model. A very crude nalysis shows that a 20% increase in sectional density would lower the velocity for equivalent xpansion by 5% More extensive testing is required for reliable quantification, but this was not done

	I admit that I had a blond moment when I read that sectional density drives expansion and I halfway disagreed. Of course, this makes perfect sense, now that I've had time to think about it. OK, I'm on board now. Glenn

Phats!

I might have to make a run to the newspaper plant for that! Probably about 1 shot per BOX!

	RIP		
	Yes, I had hoped I could slip by with 5 each! Of course 10 is better, then again, 20 each would be twice as good eh? And so on! I am thinking on it. I am thinking I might could be talked into doing 5 each for our purposes and see. This seems to be a good bullet to do that with too.		
	I think Alf has taken his leave, I am sorry to say! Maybe it's my sense of humor? I think his frustrat with me was "more than he could bear?" I know he's out there watching! Might as well come back		
	If I do 5 and satisfied with the results, and the results are consistent?		
	The "Effect of SD" explains exactly the situation I had with the ever increasing weight and therefore SD of my .500 copper HPs! The heavier I went, the less velocity it took to shear the petals! When first I was thinking in only 1 dimension!		
	Glenn		
	Follow with us my man, try not fall off the board again! But if you do, don't worry, I fall off sometimes too!		
	Now I must put some thought into this weeks shooting, have a "yankee" buddy of mine arriving this evening and must entertain him all week, of course he makes a decent paper man, maybe?

	Michael,		
	My suggestion is to do 5 of each meplat size. Then we can look at the variance of the samples and if there is overlap, we can make an estimate of the number of additional rounds needed to get statistical significance. As far as some people arguing with the results, that is a given. Some on here will argue with Einstein. or the bible.		
		ere	
	will argue with Einstein. or the bible.

	It is the ONLY use I have seen for a WSM anything! 50-458-416-9.3 B&M! Best of show? All of them! 458 is damn hard to beat. I have a couple in 20 inch barrel, a couple in 18 inches, and have a 1885 with 24 inches. It's proven to be quite a nice fit, excellent small short platform, plenty of good bullets, plenty of case, zero issues. 458 B&M is hard to beat. I had no idea you were shopping! When you are ready let me know how I can help out!			
	A good goose is hard to beat! 😌 🕮 📴 🕑 Michael			
	416 Kilimanjaro is a wildcat by Kilimanjaro on the 325 WSM. claims are: "This Rifle is chambered i very special ``416 Kilimanjaro'' cartridge developed from the 325WSM, and provides equivalent p			
	and ballistics of the 416 Rem. in a shorter, lighter action with less felt recoil." 😌 🛱 📴

	While off on the WSM tangent, does SSK have to pay a royalty to Rick Jamison whenever they chamber a 9.3, .416, .458, or 50 B&M rifle barrel? What about the me-too .416 Kilimanjaro? How far does Rick Jamison's 300 WSM crook reach? 🗐			
	I have a mind to try a .500 MDM on that 300 RUM M70 lying fallow, just to totally fly in the face of good wildcat design principles. Surely Rick Jamison has no claims on that one.			
	As for twist on the 500 MDM, or anything from .375 to .510 caliber:			
	1:12" TW IST is very magic.			
	That way the revolutions per second of the bullet is the same numerically as the MV in fps.	<u></u>

Roll	50-458-416-9.3 B&M, 500 MDM all based off the RUM case.			
Mr.	Michaels says Rick Who?			
-	.500 caliber, Rick Who?
