Just a theory from a rank amateur.

You didn't ask me, 465, but I like your theory.

What I understood from reading Rathcoombe's page was that FN bullets have sort of a wedge-type splitting effect that usually makes a wound track larger than caliber. If I understand correctly, about the only time when a bullet might make a wound track equal to caliber is if a wadcutter type is used. (Which is almost never the case.) Of course, I realize in living tissue you have to account for some "closing" of the wound track because of tissue being somewhat elastic.

I am not sure that I would say that it is imperfect but you need to be very careful how you translate those results to performance on animals.

Test media is "imperfect" in replication of the anatomy and behavioral characteristics of the mammalian body.

I am sure the media used is perfect test media in regards to the quality of the media itself.

We should work on making a stardardized medium with fiber added to the gel to simulate collagen in tissue and some bone-like layers added.

The problem I could see with this is that you'd need a different set of media for each application. For instance, for big game you'd need a different "mixture" than you would need for terminal ballistics testing against humans. Dangerous game might need another "mixture" altogether. One application obviously wouldn't easily "translate" to the other.

I feel that at some point we can accept a generalization based on preponderance of evidence and proceed to utilize the most efficient forms found to this point. Imperical results in the field will either verify or invalidate the hypothesized results.

In other words-time to go hunting, boys

Truly I dont feel that we need mathematical proof that one type or another works in such and such a way. Elmer Keith arrived at something very similar to the BBW #13 lo those many years ago in Idaho. If 465HH&H wants to hunt with RN then so be it. In the words of my Southern ancestors:

Every man has the right to go to Hell in his own fashion.

Use what make you confident-

How 465HH has shot so many round nose solids through all sorts of game and has never seen one veer off course is beyond my understanding. Don't get me wrong, 465HH, I believe you, as I know you are an honorable man and I know you would never tell it any other way, you have been a lucky chap as well! I have personally seen round nose solids turn in animal tissue, as much as 90 degrees and out. More than once. But I have also seen them do well enough to kill a few of my own elephants and buffalo as well. I have also heard many other stories about round noses failing to penetrate in a straight line, many of them from several of the guys that are looking in right now. So they will in fact veer off course in animal tissue some of the time.

That's the entire point of the test work, the test medium, and having a medium like the one that I use. They veer off course 100% of the time in my test medium, while a good flat nose solid drives straight if it has a proper nose profile, meplat size. You will also find the round nose will veer off in any and all aqueous materials. Let me ask this, what composition are most animals? A percentage of "aqueous" material perhaps?

I can tell you of a medium that a round nose will drive straight in every time! Want to know? Wood! Take any stack of wood, pack it tight, round nose bullets drive straight! Why? The wood is dense enough that it does not allow the bullet to turn. Good test material? No, it's not aqueous.

Like I said, what is successful in the test medium has proven to be successful in the field, many times over. For myself, I trust the test work, that's why I do it. Test, success, take it to the field, my chance of success is far higher than it would have been in the field, where success is even more important!

Next!

Michael

600 B&M--4.5 lbs, 35 inches overall, 16 inch barrel? 900 gr CEB BBW #13 at 2100 fps ought to do!

Hmmmmmm?

Just need a Winchester Big enough is all!

Hey, speaking of that, CrossL has joined the B&M Family! I have been busy as hell making sure his new Winchester M70 416 B&M Blue/Ultimate stock is RTG (Ready to Go). Getting his brass made for him, getting all his stuff together, making sure rifle is 100%, all those sorts of things! CrossL is going to be busting all sorts of things for us with this, and some BBW #13 NonCons soon!

Michael

I think that your statement is technically correct but I had to repeat Physics 103 three times before I passed so I am not the one to ask. 🙄 I suspect that all things being equal such as velocity, caliber, bullet shape and construction as well as stability the bullet with the higher SD also has more momentum thus a greater ability overcome resistance.

465H&H

Momentum is the mass times the velocity. How does sectional density contribute to momentum?

SD is a simple way to describe the difference in two bullets of equal diameter but different weights or to compare different diameter bullets with different weights. It is a useful tool.

465H&H

From the work on this site, these are the factors which are important to penetration in order of importance:

- Nose Profile—
- Meplat size, % of meplat for caliber—
- Twist Rate—
- Velocity—
- Construction—
- SD

. The first six would have to be equal for the last, SD to be considered. If we add consideration bullet length in the 9.3 comparison, that may well be more important than SD. As the thread started comparing two specific bullets in 9.3 which are NOT equal in all six, or in length, your comment about the value of SD in determining penetration is open to question.

HEH HEH HEH----

Hey, I take the 40mg Lipitor as well--those are kinda big, at least it's not the 80mg!

My Impressions? VERY IMPRESSIVE! Gorgeous bullets. I bet you kinda have an idea--You know those Magic J bullets you have? When MacJ sent some .510s to me, they were excellent looking! Hated to shoot them they look so good! Well, these CEBs are exactly the same, You gonna want to carry one around in your pocket and rub and admire every once and awhile!

When can you get some? They are already boxed and headed out on fed ex Monday!

Michael

I have seen and others have reported on the cutting affect of FN bullets in game compared to RN bullets. If the cutting is due to the FN how do these bullets cut tissue so cleanly if FN bullets form a cavitation bubble? The bubble pressure would be pushing the tissue away from the bullets nose, wouldn't it?.

The cavitation bubble (if one really forms) forms secondary to the pressure wave moving through tissue which does not occur until some time FOLLOWING impact. Therefore one would expect the FP to cut initially. IE: forming the entrance hole you have described.

IBT,

I believe I said exactly what you did in the first sentence. If you add bullet length in 9.3, then you also increase SD. Would a monometal 9.3 (longer bullet) penetrate farther than a lead core steel jacketed bullet of the same weight(shorter)bullet. Assuming nose shape etc. were the same. I think not.

| <p>quote:</p> <div style="border: 1px solid black; padding: 5px;"> <p>Originally posted by michael458:<br/>         How 465HH has shot so many round nose solids through all sorts of game and has never seen one veer off course is beyond my understanding. Don't get me wrong, 465HH, I believe you, as I know you are an honorable man and I know you would never tell it any other way, you have been a lucky chap as well! I have personally seen round nose solids turn in animal tissue, as much as 90 degrees and out. More than once. But I have also seen them do well enough to kill a few of my own elephants and buffalo as well. I have also heard many other stories about round noses failing to penetrate in a straight line, many of them from several of the guys that are looking in right now. So they will in fact veer off course in animal tissue some of the time.</p> <p>That's the entire point of the test work, the test medium, and having a medium like the one that I use. They veer off course 100% of the time in my test medium, while a good flat nose solid drives straight if it has a proper nose profile, meplat size. You will also find the round nose will veer off in any and all aqueous materials. Let me ask this, what composition are most animals? A percentage of "aqueous" material perhaps?</p> <p>I can tell you of a medium that a round nose will drive straight in every time! Want to know? Wood! Take any stack of wood, pack it tight, round nose bullets drive straight! Why? The wood is dense enough that it does not allow the bullet to turn. Good test material? No, it's not aqueous.</p> <p>Like I said, what is successful in the test medium has proven to be successful in the field, many times over. For myself, I trust the test work, that's why I do it. Test, success, take it to the field, my chance of success is far higher than it would have been in the field, where success is even more important!</p> <p>Next!</p> <p>Michael!</p> </div> <p>Michael,</p> <p>You have mentioned having seen RN bullets veer off course in game before. What brand, shape and metal were these bullets. I don't remember you ever detailing that info. Always meant to ask this but kept forgetting.</p> <p>465H&amp;H</p> <p>Posts: <b>5686</b>   Location: <b>Nampa, Idaho</b>   Registered: <b>10 February 2005</b></p> |                                                                                                                 |                           |

| <p>Hugh,</p> <p>No a sharp edge actually decreases penetration. Back in terminals Michael and I tested this on the #13s. A radius edge goes deeper. I'll try to find the page but Michael might be able to find it quicker.</p> <p>Sam</p> <p>Posts: <b>2823</b>   Location: <b>NC</b>   Registered: <b>08 July 2006</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                 |                           |
