Real	Sam	
Ser .	I was going to start loading for the Stick test with 458s, but I am looking hi and lo for a round nose solid in .458 and the NOT ONE OF THEM on the entire compound! Do you have any? If so, how about send a few for the test!	ere is
	Until then, I suppose I will start with .474 as I found some of those out dated old RN bullets stuffed in a box outside on range!	the
	Just starting the planning and loading process for this, don't all of you get too excited, there are still terminal boxes to prepare, loads to do, brass to prep, the works.

	Michael If the rounds lose stability before hitting the test media maybe it will save you from repairing the box from all those wa round nose bullets [©] . A sideways bullet makes for horrible SD lol. Someone please donate some RN 458s. We certainl not want to encourage Barnes to make more by purchasing any [©] that would give Barnes the wrong idea lol.

RIP one of us	posted 25 February 2012 06:18	Hide Post				
	I have not bought a round nose solid since I discovered GSC FN solids in 2001. A .416/380-grain GSC FN at 2506 fps passed straight through a 16" diameter tree trunk, and then another tree of similar size about 40 feet behind the first, in a straight line, no deflection, and kept right on going,					
	even though both trees were not perfectly on-center hits. Umbrella thorn trees in Botswana are not soft wood. Same loading passed through a cape buffalo like a laser beam also, both one kill shot and one insurance shot.					
	I predict a RN solid might out-penetrate any FN solid (of same caliber, weight and velocity) in a stack of flat, dry wood with straight-on hit by bullet traveling perpendicular to board surface. Is that a zero-degree angle of attack or incidence?					
	Any different angle of attack than that, as on a slanted, angled, or off center on a curved surface, will make the RN-solid go squirrely, as will any aqueous or non-linear medium.					
	Please let Doc M test just a few of the RN solids he already has.					
	They will all give the same results. We do not need to burden him with more Round Nose Solid bullets to test.					
	All y'all dispose of those RN-solid bullets safely! 😂					
	All y'all dispose of those RN-solid bullets safely!

	Thanks RIPActually, I am all for what you stated above. Pretty much, monkey see, monkey do, and what I test in .474 if 475 B&M will be indicative of all. They may actually do better than some may think, I don't know. It's only 3 pieces of 1 in wide board 20 ft in front of the target. I know the BBBW #13 Solids will burn straight through, straight to target and stra in the medium as if nothing happened. If they can burn through a 4x4 Post and drives straight to target, then straight through medium, from 20 ft, not much else is going to stop them.	nch			
	What I am more looking forward to is the various Softs/Expanding, and NonCons and how they react to the sticks!				
	Hopefully I can get us a couple of terminal boxes full of medium and ready to test some this week.

One of Us	Hi EZ				
AP -	Long time! Hold on to those RN for now. I am starting this project with 475 B&M, I have a few left over RN Woodleighs a Barnes, from a life prior to this one. I will start with these and work through .474 caliber and see what we come up with				
	Currently my plan is to start with .474, go to .458, .500, and .416. Completing these 4 different calibers and a range of t we have here should give all of us a good idea what happens as bullets pass through sticks.	oullets			
	You can mark this down and remind me when we finish. I believe that we will learn that it is best to avoid brush and stic we can. We can't always do that in the field. I have at least 4-5 incidents that I can recall that I hit a stick, got deflection at times caused an issue. I don't believe that we are going to find ANY BULLET that is TOTALLY IMMUNE to brush, even the mighty BBW #13. I believe that Brush Will screw things up on all of them. I believe that some bullets will do better than of bulletsthis is what we wish to identify. We will find out.	n and he			
	I have two terminal boxes ready to begin this work this week. I am still working out exactly how to conduct the entire te as to be consistent as possible and gather enough data to be able to make a determination or come to some conclusion				
	Currently I think I will begin this way.				
	First Test. Of course all the bullets I will be shooting I am not going to sight my scope in for each bullet so it hits dead center every So the first two shots of each test will be to get a Point of Impact for each bullet. Then I will proceed to shoot 3 rds thro the sticks. Knowing each bullets POI one would measure how much deflection there is from shooting through the sticks.	ugh			
	After those three rounds and measuring the deflection or no deflection, then proceed to the "Terminal Tests" of which w consist of two bullets each.	ill			
	Entire test for each bullet will require 7 rounds minimum, hoping that I don't screw anything up. So it will be fairly time consuming, but I think this will really give us some good information.				
	I plan on both solids and expanding tests in each caliber.				
	This is the plan thus far.				
	Michael

Here's an idea for measuring divergence from the point of aim after passing through sticks. You may have already thought of it or something similar, but here's my idea.

Because your aiming mark will be hidden by the sticks, you need another type of target.

Use target sheets behind the sticks that have a dark horizontal line and two dark vertical parallel lines crossing the horizontal. You can then put the sticks in front and line up your scope crosshair to overlap the horizontal line and bisect the two vertical lines. This will put the centre of the scope crosshair over your intended POA even though you can't directly see it.

Stick Test Target

Real	Just come off the range today. Yes, I did some STICK TESTS.					
Mar .	#1 Revelation NO .474 Caliber SOLID IS IMMUNE TO HITTING STICKS!					
·- •	#2 Revelation I will NOT BE doing Terminal Tests on ALL of these Solids!					
	#3 Revelation Some Bullets did Better Than OthersHowever ALL WERE EFFECTED.					
	My procedures worked 100% Perfectly. I chose a different target than what I normally shoot, turned it "Long" way so th could see each side of the target for elevation at 25 yds, lining up with the top target above for windage. I shot 2 round target for POI at 25 yds, dropped to the bottom target that was lined up perfectly with the sticks installed. Center up, sh replace sticks, shoot again, replace sticks, 3rd shot.	ls top				
	So 2 in the top for POI3 in the bottom for deflection going through X3 sticks, 1 inch wide.					
	I have tested the following;					
	450 BBW #13 Solid 500 BBW #13 Solid 500 Woodleigh FMJ 500 Barnes RN 500 Barnes Banded FN 425 North Fork FPS					
	500 OLD Sledghammer 500 Hornady DGS					
	I will be working on the data and get it to you when I finish.

Calvitouda,	When you test the .458 caliber NonCons how about running a few shots with the BBW#13 HP NonCons through the stick test using one of your slow twist rate lever guns? I'm just wondering if the NonCon performance will overcome the slow twist rate just as the FN Solids do.					
	If they perform as expected, perhaps that'll give the users of factory slow twist rate barrels something to think about.					
	Thanks,

Sec. 1	I can do that! Right now working the 475 B&M and .474 solids. I am also going to do the 475 B&M Super Short, and it's bullets as well.					
	Then fall in with expanding and Noncons in .474 caliber. Tests are going very good right now, some real surprises, some disappointments, and some expectations met.					
	I did everything at 10 feet, and everything is effected, some more, some less. 20 feet would have been a disaster and resulted in RANGE DAMAGE by some bullets.

	I would not mind to do a 45 Colt test. I have a little 16 inch Winchester 94 that I have shot extensively over the years! It's	's
	even been to Africa several times in years past. When I finish with the "Main Events" 416-458-475-500s then I can look at other projects to continue. But not until I finish the main agenda.	
	Boomy, No I won't be shooting balls! They have no relevant place in the field. Only bullets we use or might potentially use the field. Anything else is a waste of time. I already have a rather large agenda with this, an it will most likely take months work through.	
	Jim	
	OK, I just put the work on the B&M Site last nightYou caught that quickly I see! Yes, I feel like this is a fairly important stu I have been effected by brush in the field, recently we saw LionHunter hit a branch in front of his elephant, could have bee disaster, many many others have had the same issues. So I devoted a page on the B&M site to the study, like much not directly related to a particular B&M, this can be found under "Additional Research" Main Page on the left side, scroll down u you see "A Study In Brush Deflection" I think I called it? Direct links;	en a

OK, let's actually look at some "Brush Deflection".

#1-- 2 rounds at 25 yds NO Obstructions for Bullet Point of Impact.

Target is kept as POI to measure Deflection on Target two.

#2-- 3 rounds with each bullet tested at 25 yds with Sticks set at 10 Feet in front of target. Each bullet striking 3 sticks along it's path to the target.

Each Bullet on Target two is measured how far it struck from it's own POI from Target 1. 3 entries are made for each bulletthen those are totaled for a Total Deflection of the 3 bullets--then an average deflection of the 3 listed at the end.

Some of these bullets become unstable, some hitting completely sideways, noted at the end.

Here is the document thus far--and this can be downloaded from the B&M site in pdf format if you want.

As you now can see my 425 North Fork FPS did very well in the test, right along with the BBW #13s. I had a few 500 gr BBW #13s left over from some of the first ones we did. While a little heavy for the 475 B&M which is far more suited to 450 grs than 500, it did very well, better than any of the other 500 gr bullets.

Here are the North Fork POI and Deflection Targets; For some reason the first round dropped a bit low, I had to shoot 3 for a POI.

As you can see two rounds were nearly POI, and hardly deflected at all. One went a bit astray.

Next best in line is the 450 BBW #13 Solid. Rifle is sighted for this bullet. I was pleased with how consistent the deflection was, never straying too far from POI.

The 500 gr ${\rm BBW\,\#13}$ Did rather well too. POI on all the 500 gr bullets was hi and slightly right.

by 3 inches.

To my disappointment the 500 Barnes Banded was not nearly as effective as I would have thought it would be. While it is a very excellent nose profile for the hard stuff--T'Rex tests, and it is a proper nose and meplat size to drive straight and deep, it just did not do so great in the Brush Deflection test. It shows no consistency.

	I am quite sure I am getting ready to be crucified by the Woodleigh Cult, and of course the Hornady fans as well. I am sure there will be reasons the test is not valid, and is meaningless, as it is not real branches only flat cut sticks! I am sure the will be plenty of excuses thought of, and made up as to why ones favorite bullets did not perform well, once again. Well sorry to tell you this, but I am just the messenger, they fall where they may. All bullets were effected. Flat Sticks have to far easier test than round harder branches. If a bullet can't get through these flat sticks, it damn sure is not going to go through any sort of brush! AS YOU CAN ONCE AGAIN SEE CLEARLY-ALL FN SOLIDS ARE NOT CREATED EQUALALL RN S' ARE NOT CREATED EQUAL. End of Story! I will not be doing very many Terminal Tests with most of these, maybe a few, but those that cannot stabilize and cannot remain with any sort of consistency are not going to be tested on my range, I don't feel like spending time to do the rep which takes away time from doing test work. That's it guys, that is what I have thus far. Michael	ere I I am o be OLIDS ot

	Helpful work. Now the questions.	
	1. Did the bullets with wider, dispersed results, have different patterns on the wood slats? E.g., did any of the slats snap off at POI? Or did any of the impacts get close to the edge of the slat?	
	2. Could there have been any movement of the slats in the later tests? E.g., did the slat trolley change position and angle ever so slightly? Or did the slats start to bend forward or backward a little bit?	
	3. Are these tests repeatable? E.g. will the same results occur? Or will they occur when performed in a different order?	
	Repeatability is important for data confidence and determining influences

	Yes No ?? Different order???						
	Very repeatable. Will not get the same resultsNo telling where a bullet might strike after being destabilized?						
	Order?? Not sure what you mean. I think if we repeated the same exact test over again that the order of resultsBest to the worst bullet would not change position very much. Next time the BBW #13 might do better than the North Fork close. Next time the Barnes FN might do better than the Barnes RN. But at no time with the Hornady or Woodleigh do b than the North Fork or BBW #13. They may all strike different than this test, but overall results in order will be close.	Very

One of Us	I wonder if the dry lube coated barnes bullet helped limit deflection.						
	Inanks for a great test! Seems in the thick stuff some bullets are better and could make the difference between a dead animal and a wounded dangerous animal.

AP	"Deflecting" off topic a bit. I noticed this thread will soon have 200,000 views! People love to learn the truth about bullets. Can any tell us how the views are counted? For example are non member yews counted and repeat views ect.

	Order?? Not sure what you mean.				
	By order I meant doing a test starting with some of the 'bad' and proceding to the good. I know that this shouldn't mak difference, but it would be good to check repeatability. That would rule out things like fouling build-up.	ke a			
	However, it might be that some bullets are more unstable at different muzzle velocities. You have already noted how th moves around. That often fluctuates with velocity and powder because of barrel harmonics. What we want to do is to r the influence of bullets that leave the muzzle 'not yet ready to sleep' vs. bullets that leave at the right harmonic and 're sleep'.	remove			
	It may take a little work and experience to get a handle on the factors, just like with meplat and 13-degree, rounded en	dges.
