I beleive this projectile to be a significant development in the recent history of hunting/shooting projectiles and you guys are responsible for making it happen so that we may reap the benefits of its' performance. Beautiful stick of wood on that .500 you took over Mike ! How did you find the Nikon Monarch scope ? I note that the Raptor you used in .500 is a 350gn. I hope that the standard non-con in this caliber at 460gn will continue to be available. Your results with the Raptor have totally satisfied me that I will more than likely only ever mostly require the non-cons as my primary back-up slug. The petals appear to be doing horrendous damage upon entry, entries clear cut and open as well as the exits allowing constant and copious blood loss/flow from the wound which is what we are all looking for incase we ever come up against an animal that is able to survive the initial damge inflicted by these bullets. The fact that the remaining portion of the slug continues to penetrate and in most cases provides complete penetration is the perfect scenario Kudos again to all those involved with the development and manufacture of these outstanding projectiles. | Real                    | Thanks Guys. Yes, ugly photos, not normal I think to post such things, however in the name of science I suppose it's acceptable.   |  |  |  |  |  |
| M.Y                     | Over all in both animal reactions and terminal study I found these bullets to be more devastating than anything I had worked<br>with before. Penetration was awesome to say the least, and to take into consideration they are extremely light for caliber as<br>well. On these same type animals I have recovered many of the premiums and non premiums I have worked with in the past,<br>Barnes TSX, Swifts, Woodleighs, Hornadybut not one Raptor. I like penetration as you know.   |  |  |  |  |  |
|                         | Paul   |  |  |  |  |  |
|                         | Yes, that is the little 19 inch 500 MDM and a stick of English by Accurate Innovations. It's darker than most English I have. And 19 inches because I could not let you and Andrew both have shorter 500s than I!  |  |  |  |  |  |

|                         | Paul, I am happy to say, the .500 caliber NonCons as you know them no longer EXIST!!!!!  |  |  |  |  |  |
|                         |  |  |  |  |  |  |
|                         | OK OK OKHEH A couple of weeks ago I changed the specs on the cavitymade it wider for Lower Velocity Shear Points.<br>There are 3 I think now NonCons, slightly lighter weight because of the wider cavity340 for the Super Short365 For the<br>Levers450 for the 50 BM and the 500 MDM. Same bullets, just wider cavity for better shear qualities. Have the first shipment<br>coming in this week, will start testing for Low Velocity Shear Points by next week. Improved!   |  |  |  |  |  |
|                         | Paul, Yes I think the NonCon will handle 98% of all back up for what you are doing, and will cause a tremendous amount of damage, stopping bad things from happening.  |  |  |  |  |  |
|                         | As for sticks of wood, I have those two gorgeous sticks of bastogne from Wes that just come in this week. The rifles should be<br>on the way from SSK this coming week, 50 B&M, and 475 B&M, matching gunkote rifles that will go in the new sticks. This gives<br>me matching rifles within caliber, Stainless and black matte gunkote, at least in 500 MDM50 B&M475 B&M-and 458 B&M. Soon<br>will have it in 9.3 B&M as well. All with decent sticks of wood on them. When I get the two matched up will take some photos of<br>those. |  |  |  |  |  |

|                         | Let's see if this answers that question, I ordered TWO MORE yesterday!   |  |  |  |  |  |
|                         | That, too, is good news.   |  |  |  |  |  |
|                         | FTR- the Monarach African is 4.1 to 4.0" eye-relief, which is great.<br>The Monarch 2-8 (a great little scope for a short rifle) is 4.0" to 3.8" eye-relief at 8 power. Eye-relief has always been plenty on<br>Rigbys loaded to 6000 ftlb, how much more for a 9.3B&M!<br>But   |  |  |  |  |  |
|                         | I'm still going with the Nikon 1.65-5.0-power Slughunters for the 500AccR because I can't see a downside to 5.0" eye-relief<br>throughout in a scope designed for heavy recoil and having clear, bright glass.   |  |  |  |  |  |
|                         | Rob thinks 5.0" is unnecessary, but things happen in the field under hunting pressures and if I end up with a bruise on my bicep<br>(improper angle on quick-shouldering rifle) I don't want a cut on the eyebrow as frosting on the cake.   |  |  |  |  |  |

| Hard St.                |  | nk you for the article, Boom. And the guys were impressed enough to suggest building a custom rifle around the bullet!<br>In brings me back to the real world.   |                  |  |  |
|                         | I ha   | ve a rifle in .510 (500AccR finished and waiting for me in the US) and about 100-day window before I need to load up th<br>ds for transport. But which bullets will be available before the 100 days end?  | ıe               |  |  |
|                         |  | need something with a bit of a BC (.350 would be nice) for shots over 200 yards. Accuracy is essential, of course. And ir<br>ometal designs we would prefer 450 grains or under rather than over 500 grains in order to get the velocity up a bit.   | ı                |  |  |
|                         | CEB only have a 535 grain non-con. It is a great bullet up close but the BC sucks and it will be a bit slow, too. Will CEB have a 380 grain Raptor tipped in time for the summer? I don't really need the boat tail if a shorter flatbase would help stability. A similar sized solid would be needed.   |  |                  |  |  |
|                         | The go-to bullet at the moment might be the GS Custom 450 grain. Its BC is tolerable, .328, but I would prefer without moly<br>plaquing-up a new barrel. Its weight allows good hunting velocity, say 2600 fps. That bullet would be good for 300 yards and<br>should still fully penetrate buffalo up close. It's 300yard winddrift in a 10mph crosswind is 12", for comparison with bullets below. |  |                  |  |  |
|                         | I'm l  | eary of the lighter Woodleighs. They don't offer much in BC and would probably overexpand at 2600+fps.   |                  |  |  |
|                         | -  | gher bullets in .510" all end up heavy.  |                  |  |  |
|                         |  | Swift A-frame is now available in 570 grains. But its BC of .306 produces 18" of winddrift at 300 yards when fired at 230<br>10mph crosswind!! Not enviable. But the bullet will do its traditional job if it touches the animal.  | )0 fps           |  |  |
|                         | Barnes has a 570 grain TSX with a .369 BC that is "only" 1.75 inches long! Does the AccR case have enough spare capacity to seat the bullet 1" and still produce 2300fps? Probably, because the long freebore will allow faster powders to be used. While not desired, that might be a second choice after the GSC 450 grainer.<br>Finally, the big daddy  |  |                  |  |  |
|                         | traje<br>the   | es has a 647 grain TSX with a BC of .572 and ONLY 1.89" long. If it could be pushed to 2150 its high BC allows a huntir<br>ctory out to 300 yards (-18", with 2" sight-in, 160 yard zero) and gets the wind-drift down to 9". That totally shuts dow<br>A-Frame. But that will probably be a singleshot load because of the bullet length. the seating bands are towards the ba<br>leek bullet. We would need alot of solids for the magazine. | wn               |  |  |
|                         | I su   | ppose that we could also 'single-shot' the CEB 535 with a pinnochio tip. Did those test as stable and accurate?  |                  |  |  |
|                         |  | have a strong interest is seeing a CEB .510" developed over the next couple of months. I'll buy 120. (I just don't get to<br>ot enough)  | 2                |  |  |
|                         | 450<br>Shoi<br>BC c  | cing for:<br>grains or under. 380 grains would be fine, as Michael has shown.<br>t, curved-ogive Raptor tip, hollow point.<br>ver .300, possibly .350-400.   |                  |  |  |
|                         |  | ar shaped FN solid.<br>makes a nice 4th of July wishlist.  |                  |  |  |
|                         |  | +++++++  |                  |  |  |
|                         | 500  | ell-rounded hunting battery might include:<br>AccRel Nyati, 416 Rigby or 416 Ruger, 375Ruger or 338WM, 308 or 270, 243, 223"<br>serving creation, hunting the harvest.   |                  |  |  |

|                               | You see, each and every time a bullet is "Improved" upon, the older version becomes obsolete in the system so as to avoid   | 1                |
| <b>4</b> 84.                  | confusion in the future. The wider cavity will lower the shear velocity by 200 fps or so, very important. Weight does drop so<br>but is of no consequence to begin with. Higher velocity shear is enhanced by the wider cavity as well, resulting in increased<br>trauma during the first 12 inches + of penetration.   | me,              |
|                               | Obviously the now obsolete versions worked rather well at DG RangesI used the 460 BBW #13 NonCon in .500 last year several buffalothe new one will work even better with it's wider cavity. But for sure, not to worry, if you insist on the now  |                  |
|                               | obsolete version, I have plenty on the bottom shelves here that I can save for you! HEH HEHI made room this weekend<br>in the new .500 stock of NonCons that arrive this week! LOL  |                  |
|                               | Tanz  |                  |
|                               | As for .510 I don't see the Raptor being more than 375 grs. Which is more than enough to do about anything you wantno zebra, wildebeast will be able to retain one of them, that is pretty much a given based on the performance of the 350 .500  |                  |
|                               | There is some news on lighter .510 BBW #13s however! Speaking to Dan on Friday, Sam has ordered a run of .510s500 of Solid465-475 gr NonCon. I think this for our upcoming buffalo trip "Down Under" and his 500 Nitros. I slipped in on that or for a few of them for myself as well!!! HEH HEH As we well know one does not any longer need to hold on to traditional Values concerning penetration of these bullets. | rder             |
|                               | All big bore tips will be the new design with the HP down the middle. BC?????   |                  |

| ALC.                      | quote:   |                  |
|                           | Speaking of obsolete:<br>Going from 460-grainer to 450-grainer on DGBR-HP W07?   |                  |
|                           | I trust results will be the same in lethality, but will the "W-number" of the bullet change?   |                  |
|                           |  |                  |
|                           | Correct! Number will changeto what I don't know yetWill find out this week when the new shipment comes15 boxe<br>of the new NonConsI think there is 3 of them currently in .500. Super Short 340 or soLever 365and the 450 for the<br>All numbers will change so there is never a mix up down the road while some of the older obsolete ones lurk about. |                  |
|                           | And that is the way they are supposed to shoot tooyour target far Right! Every single time they will do that here, reg<br>rifle or cartridgeproblem is, I don't do that every single time myself! I have a number of those sort of targets with thes<br>-When I do my part!  |                  |
|                           | This is why it is SO EASY to tell when something is not just right! The 350 ESP Raptor will shoot every bit as good as yo with the 460s! But NOT THE 400!!!!!  | ur target        |
|                           | Those groups with the 400 at 1 inch and .8 inch, not bad if you were looking at a conventional bullet and it was consist<br>acceptable for a Raptor or BBW#13. While they may look like they are somewhat stable, put into the test medium stabi<br>show up quickly I am sure.   |                  |
|                           | Very Fine Shooting!  |                  |

RIP one of us

Doc M, I know what you mean about doing your part in shooting groups. I muffed the group above for sure! Can't depend on the bullet to shoot itself, but "smart bullets " are in the pipeline at CEB, surely, cutting edge as they are. 😏

|                        | While I believe 'how far is to far' is a personal thing between the shooter and the shootee. That said, my personal 'how far' it is individual shot defendant upon my ability to deliver a clean killing shot at a distance that I've proven are within to so so. Anything outside that distance - whether 15yds or 400yds - is 'to far'.   |  |

|                        | I liked how he tested the petal dispersion in OSB plywood. Shows you the power of the petals.   |  |
| Nº I                   | This was from the Chuck Hawks Link I posed yesterday.   |  |
|                        | The name "Cutting Edge Bullets" (http://site.cuttingedgebullets.com/) is appropriate to their products in more ways tha<br>Every bullet they make is cut on computer numeric lathes. This process gives them the ability to make bullets that could<br>made by standard bullet manufacturing processes. Cutting Edge bullets are either solid copper or solid brass.  | not be   |
|                        | The bullet bodies are actually undersize. The bullet body is machined to land diameter, intended to ride on the lands of<br>rifling. Either at the back or the center of the bullet there are one or more ridges that are sized to the groove diameter,<br>ridges engage the grooves of the rifling and provide a gas seal. This idea was adopted from W WII battleship guns, whi<br>approximately quarter inch wide and quarter inch deep rifling in the barrels, making it impossible for a steel jacketed 16<br>projectile to engage the rifling. Thus, at the back of the projectile there was a large copper band that engaged the dee<br>provided the gas seal and imparted spin to the projectile. Cutting Edge has taken this idea and adapted it for our rifles<br>design and manufacturing techniques.  | The<br>ch had<br>″<br>p rifling,                                   |
|                        | Their solid copper series include three different designs: Matched Tactical Hunting (MTH), Matched Tactical (MTAC) and F<br>Hunting (FBH-HP). The MTH are available in calibers from .22 through .50 BMG. The MTAC are available in 6mm through .<br>All are spitzer-type bullets. We will be reviewing the copper series bullets at a later date.  |  |
|                        | Their solid brass series include the Dangerous Game Brass (DGBR), Dangerous Game Brass Hollow Point (DGBR-HP) and<br>Raptor. The DGBR is available in .22 through .62 calibers. The other two are available in .22 through .50 BMG calibers. T<br>series features what Cutting Edge Bullets calls "The BBW #13 Nose Profile," which is a blunt-nose bullet with a 13 degr   | ne brass   |
|                        | The ESP Raptor bullet is a combination of the DGBR and the DGBR-HP, with the rifling engagement ridges in the center o<br>bullet and one end of the bullet a hollow point and the other end solid. Both ends have the 13 degree taper. Conseque<br>bullet can be loaded with either end forward, as a hollow point or as a solid point. Either way, it is a boat-tail.  |  |
|                        | The hollow point is computer numeric control machined into the tip of the bullet. It is unlike any hollow point available a<br>else. It is designed so that on impact, six segments separate from the main body of the bullet to take their own paths.<br>addition, for the brass hollow points, there are plastic tips available that snap into the hollow points, making them plast<br>spitzer boat-tails.  | In   |
|                        | The brass bullets we received from Cutting Edge Bullets for testing were 450 grain Dangerous Game Brass (DGBR) in .4<br>(2012 MSRP \$29.28 for 18 bullets); 280 grain DGBR in 9.3mm caliber (2012 MSRP \$60.29 for 50 bullets) and 255 grain D<br>Game Brass - Hollow Point (DGBR-HP) in 9.3mm (2012 MSRP \$74.44 for 50 bullets).  |  |
|                        | The rifles we used in testing these bullets were a Browning 1885 High Wall in .45-70 with a Redfield 2¾ power wide vie<br>and a CZ 550 American Safari Express in 9.3x62mm with a Weaver Super Slam 1.5x6x30mm scope. These rifles have pr<br>be accurate and reliable with several different bullets.  |  |
|                        | It should be emphasized that Cutting Edge bullets are not suitable for every caliber and every load. In requesting bulle<br>testing, I did not do enough homework and mistakenly requested bullets that could not be loaded to their full potential<br>.45-70 rifle. The load I have developed for the .45-70 is a 350 grain flat base moly-coated Barnes X-Bullet with 52 grain<br>IMR3031 at 1825 feet per second (fps). The 450 grain DGBR bullet from Cutting Edge Bullets is long at 1.412 inches, cor<br>a 500 grain lead bullet at 1.20 inches. Loading the .45-70 to an overall cartridge length of 2.8 inches meant that the Cu<br>Edge bullet seats into the cartridge over 0.2 inches deeper than normal. This left only enough room in the case for 46.5<br>IMR3031, solidly compressed, yielding a muzzle velocity of 1590 fps. That is the .45-70 load we used in our testing. The<br>bullets are designed for deep penetration and should be driven at as high a muzzle velocity as possible. The DGBR 450<br>.458 bullets would be more suitable for use in .458 Winchester Magnum rifles. This problem could arise in other calibers<br>your homework before ordering. | in the<br>s of<br>npared to<br>tting<br>grains of<br>DGBR<br>grain |
|                        | Guns and Shooting Online staffers Chuck Hawks, Jim Fleck, Gordon Landers and I shot the .45-70 for record from the be<br>using a Caldwell Lead Sled. At 100 yards, our three shot groups with the 450 grain DGBR bullets were good: Jim shot a<br>Chuck shot 1-5/8" and I shot a 1-1/8", which is about the same size group I shoot with the 350 grain X-Bullet. With the<br>9.3x62mm CZ and the DGBR-HP 255 grain bullet, Chuck shot a 1-½" three shot group, Gordon's best group measured 1<br>mine measured 1".  | 2" group,  |
|                        | The DGBR-HP bullets will accept plastic ballistic tips which improve the ballistic coefficient of the bullet. I did testing over<br>chronograph and at 200 yards with plastic-tipped DGBR hollow points and the DGBR solids. The average muzzle velocity<br>hollow points was 2431 fps and the muzzle velocity for the DGBR solids was 2418 fps. The hollow points with no ballisti<br>shot groups averaging 2-1/8". The DGBR hollow points with ballistic tips shot groups averaging 2-1/8". The DGBR solids s<br>groups averaging 2-3/8".   | of the<br>tips   |
|                        | Cutting Edge Bullets make two plastic tips that can be used in their hollow points. One is a full spitzer (generally suitab<br>only in single shot rifles, due to the increased bullet length) and the other is a shortened, semi-spitzer shape intended<br>repeating rifles. In the 9.3x62, both tips made the overall length of the bullets too long to feed in the magazine. If the p<br>tips are to be used, the bullets must be seated deeper into the case. In the 9.3x62, I din't feel the plastic tips improve<br>trajectory enough to warrant using them. They may be more beneficial with longer range calibers, such as .270 Winches   | for use in<br>Iastic<br>d the                                      |
|                        | To test the performance of the DGBR-HP, I used a medium consisting of ½ inch layers of oriented strand board (OSB). I<br>these boards up in any number of layers and after firing through them the layers can be separated to see the trajector<br>each segment of the hollow point bullets. After firing four rounds into OSB at 100 yards, I found that DGBR-HP bullets fu<br>exactly as claimed. I recovered the first segment in the 4th layer and all six segments had separated by the 7th layer, v<br>center core exited out the back of 12 layers. This performance was consistent with all four shots.   | es of<br>nctioned  |
|                        | Cutting Edge bullets are intended for hunting; they are not plinking bullets. They are expensive, but technologically adv<br>Even though homogenous (usually copper or gilding metal) bullets are available from other companies, Cutting Edge Bu<br>taken their solid brass bullets to the next level. The bullets function so well that I could see building a custom chambere<br>around them, especially a medium or big bore safari rifle in 9.3mm, .375, .416 or .458.   | llets has  |

|                               | Boomerjust what are you going to hunt with 3275 fps but only a .275 BC?  |                  |
|                               | Speed is for flat trajectory, but flat trajectory needs a good BC when over 300 yards. I would much prefer a Raptor in the grain range if it had a +.400 BC. You can still load it to 2900 fps in a Rigby. You will give up 2" at 400 yards to the 3300fp: but you will resist winddrift and hit with considerable more energy and momentum. They count, too.                              |                  |

|                               | Best option for you might be a tipped non con for long range. At top velocities that light of a Raptor should be functional of 500 yards. If you know you are hunting at 500 yards have a 200 yard zero and know the flight path. My guess is a lot of under 300 yards and 400 would be a long shot. Assuming a 300 yard range and 150 yard zero the flight path won't be to of a rainbow. | PG is            |

| The Co                        | Boomstick<br>I agree with everything you say, I just don't see how a 250 grain Raptor is an improvement over a 320 grainer in .416.  |                  |
| A CONTRACT                    | the Tanz stalls for time   |                  |
|                               | Yes, a 250 grain Raptor in .416 would have the new MINIMUM SecDensity of .200. But why go absolute minimum?  |                  |
|                               | Tanz reconsiders   |                  |
|                               | Then again, maybe we haven't yet seen what a Raptor core will do when transversing an animal with a 3000 fps IMPACT<br>buffalo at 100-yard or less.  | on a             |
|                               | I sure hope they fly straight and stable, because I can't test them in the US before travelling to TZ. Might be a good use ftlbs in an "all-purpose" diameter.   | of 6000          |

|                                | Well, a 250 Raptor could be loaded to 3300 fps without a problem in 416 Rigby<br>BUT I just did a stability check for our 16.5" twist Rigbys: Stab.Fac. is 1.43, assuming a relatively short Raptor of 1.5" bull<br>length.   | et             |
|                                | That's the kind of stability factor that we see down in the little bullets like 22-27 calibre, not bigger bores. It SHOULD fly n<br>but it would be reassuring if someone would be able to test these in the US in a CZ-original-barrel 416 Rigby first. Also, s<br>would replace current 350 grain bullets in situ with these new ones, but without the option of adding more of the same<br>I might only be able to get 3200-3250 fps. Do you suppose the buffalo would notice? | ince I         |

|                                | A 275 grain 416 with ogive tip would be good. Basically a scaled up 9,3 or 375 raptor. You could extrapolate the damage did with a larger diameter and 300 to 400 more fps impact velocity.   | the 9,3        |

|                                | Maybe a call into CEB to see what the target weight for the 416 would be. My guess is between 250 and 275 grains and talon tip.   | ogive          |
