(A)	Hey, and it's not just the 375 🞉 either, I have a crap list of calibers!	
MF.	Every redneck hillbilly in SC has a "7 MM MAg", and they think it is the most powerful piece of wor could be in existence, big enough to take on elephant, buffalo and probably even Dinosaurs!	rk that
	7mm anything Associated with RedNeck Hillbillies!	
	I grew up with Elmer Keith! I suppose along the way I was indoctrinated a bit. Remember all the Keith/O'Conner arguments? I grew to absolutely despise anything that started with "270". And I no O'Conner fan either!	
	270 anything	
	Now the flip side of the O'Conner thingI know Bradford O'Conner, Jack's son. Brad and I communicate quite a bit, of course now I have toned down my distastes, and even had to purcha one of the recent published works of O'Conner, because of Bradford! Also have been sent some photos of Bradford and his Dad hunting and such! I still would not have or condone a 270 for anything, not even rats, but I keep that to myself when discussing things with Brad!	ise
	You see, I can be a decent Diplomat! Almost

1993)	Michael, You're missing out on one of the joys of small calibre hunting without a 270Win. Amazing little ca Jack was right, you don't need a 7mmRM when a 270 is tuned up and ready.	libre.
	Keith and O'Connor. 338's and 270's for small calibre work. Appreciate them both. The only probl with 338 and 270 is that with both of them around one doesn't need a 30. Sort of like with a 338 416 around one doesn't need a 375. Well, that last comment is worth a nice glass of red wine.	
	+-+-+-+-+-+	
	"A well-rounded hunting battery might include: 500 AccRel Nyati, 416 Rigby or 416 Ruger, 375Ruger or 338WM, 308 or 270, 243, 223" Conserving creation, hunting the harvest.

OK OK OK---I am going to fess up on a few things, just to clear the air once and for all!

Small bores I mess with, sometimes, but not very often, and they bore the hell out of me. Used to, if I wanted to do any small bore work, I had to take at lest 3-4 rifles to the range, one being the small bore, others big bores, shoot a little with the small bore and gather data, shoot the big bores to keep my interest up. I have had some small bores that never got 20 rounds through them before I quit with them because of lack of interest!

223 Remington--obvious reasons, mostly the rifles that come in 223. I do have a couple of new/old bolt guns, M70s with 1:8 twists that I have been playing with from time to time.

223 WSSM--That little 22 inch Ultimate. That little tiny speed demon, can't believe how fast it can run things in that little rifle. What does one do with it--I don't know, I only have one, and that is more than needed, but makes a good test gun for hi velocity 223s.

25 WSSM--Strictly because of the 22 inch Ultimate. 25 is getting big enough to hammer those really big rats one runs across from time to time, and the rifle is so tiny, light and easy to carry. I have only one of these, more than enough.

6.5X55 Swede Win M70---This is Moms rifle! It's mild, she loves it, it's a FeatherWeight Stainless, no big noise, no recoil, nothing about it scares her, and with the right bullets she can put it to work for her.

6.5 WSM--Yes, I have two of these. 6.5 has intrigued me a bit, and since I won't have anything here in between this and .308 it works. First one of these I blew Up! The only rifle I have ever blown! I was on the PHONE--Loading 6.5 WSM Test Loads! Distracted. I forget exactly what H powder I was supposed to be using, but used a heavy dose of H-4198 instead! Not Good! I still have that case, and that action here as a reminder.

Built a 6.5 WSM FeatherWeight after that. I don't shoot small bores well at all, and I have no patience with that tiny barrel heating up. But in 2008 when I took the boys to South Africa for their first plains game hunt I figured that was a good time for them to try it out. I had a 120 gr Barnes TSX loaded to a bit over 3300 fps. They used it on warthogs, impala, hartebeast, bushbuck, and probably some other things. It was hammer and dropped these species in their tracks. I was actually impressed with it's performance! I would have never figured! I took the boys and sit at a water hole and was going to shoot a piggy for myself with it. This was the only rifle we grabbed off the truck. Sitting there not long and damned if here didn't come 5-6 wildebeast! Well, I love to shoot wildebeast, and the closer the biggest bull got, I could not contain myself any longer and busted him when he got to about 15 yards! He did not go 20 yards and piled up stone cold! Again, I was rather impressed with the performance of the cartridge and the bullet!

Did not care for that little light barrel, so I had Brian build a heavier barrel version some time later, and it's the one I have been using to test the Raptors and other bullets.

Skip every caliber up to .308. And I don't care much for this caliber either. I have a couple of 308s, and a couple of 300 Winchesters. They don't see much use other than test guns.

338s! I got lots' of 338s--338 Winchester, 338/06 For Sale, 338 WSM, 338 Ultra. Because of the 9.3 B&M these won't be going out anymore. Too big, too long. But have hunted a good bit with 338 caliber.

.358! Got lot's of 358s. Like 358 better than 338. Had 35 Whelen-gone now, have 358 STAs, and 358 Utlras. Shot a hell of a lot of beasts with 358 STA in the day. Just excellent, again, 9.3 B&M being able to out perform it with the Raptors, and being so much smaller, these 358s will never see the field either.

So there, those are my rat guns. They don't get a lot of attention unless I am testing something these days.

I don't hunt deer and anything of that size I can use the 9.3 to better effect on anything, and the rifle is actually smaller and lighter than even the small bores, and far more effective. I am not much of one to shoot and have to follow a blood trail. I would just as soon put these smaller critters in the dirt right where they stand and be done with it. Following up these sort of things takes time away from doing real things! So not many small bores in my future, not in the field anyway!

Ś	We are awaiting some real bullets to work with. Should start coming in this week. Think everyone behind schedule right now. I was also running low on some calibers, so had to order some more o those, all total 1500 + bullets on the way at least.	
	Also received the PTII back this week! So far hook up in the lab looks good. Stand alone computer nothing but PT II on it. Maybe, just maybe we are back in the pressure trace work? Crossing finge and toes that it is so! I have some projects I need to check out on that front.	
	I think it might be possible we will be doing some terminals this week when the bullets arrive. So go anywhere!	don't

	quote: Originally posted by michael458:	
	OK OK OKI am going to fess up on a few things, just to clear the air once and for all!	
	Small bores I mess with, sometimes, but not very often, and they bore the hell out of me. Used to, if I wanted to do any small bore work, I had to take at lest 3-4 rifles to the range, one being the small bore, others big bores, shoot a little with the small bore and gather data, shoot the big bores to keep my interest up. I have had some small bores that never got 20 rounds through them before I quit with them because of lack of interest!	
	223 Remingtonobvious reasons, mostly the rifles that come in 223. I do have a couple of new/old bolt guns, M70s with 1:8 twists that I have been playing with from time to time.	
	223 WSSMThat little 22 inch Ultimate. That little tiny speed demon, can't believe how fast it can run things in that little rifle. What does one do with itI don't know, I only have one, and that is more than needed, but makes a good test gun for hi velocity 223s.	
	25 WSSMStrictly because of the 22 inch Ultimate. 25 is getting big enough to hammer those really big rats one runs across from time to time, and the rifle is so tiny, light and easy to carry. I have only one of these, more than enough.	
	6.5X55 Swede Win M70This is Moms rifle! It's mild, she loves it, it's a FeatherWeight Stainless, no big noise, no recoil, nothing about it scares her, and with the right bullets she can put it to work for her.	
	6.5 WSMYes, I have two of these. 6.5 has intrigued me a bit, and since I won't have anything here in between this and .308 it works. First one of these I blew Up! The only rifle I have ever blown! I was on the PHONELoading 6.5 WSM Test Loads! Distracted. I forget exactly what H powder I was supposed to be using, but used a heavy dose of H- 4198 instead! Not Good! I still have that case, and that action here as a reminder.	
	Built a 6.5 WSM FeatherWeight after that. I don't shoot small bores well at all, and I have no patience with that tiny barrel heating up. But in 2008 when I took the boys to South Africa for their first plains game hunt I figured that was a good time for them to try it out. I had a 120 gr Barnes TSX loaded to a bit over 3300 fps. They used it on warthogs, impala, hartebeast, bushbuck, and probably some other things. It was hammer and dropped these species in their tracks. I was actually impressed with it's performance! I would have never figured! I took the boys and sit at a water hole and was going to shoot	

	a piezy for mycolf with it. This was the only rifle we graphed off the truck. Citing there
	a piggy for myself with it. This was the only rifle we grabbed off the truck. Sitting there not long and damned if here didn't come 5-6 wildebeast! Well, I love to shoot wildebeast, and the closer the biggest bull got, I could not contain myself any longer and busted him when he got to about 15 yards! He did not go 20 yards and piled up stone cold! Again, I was rather impressed with the performance of the cartridge and the bullet!
	Did not care for that little light barrel, so I had Brian build a heavier barrel version some time later, and it's the one I have been using to test the Raptors and other bullets.
	Skip every caliber up to .308. And I don't care much for this caliber either. I have a couple of 308s, and a couple of 300 Winchesters. They don't see much use other than test guns.
	338s! I got lots' of 338s338 Winchester, 338/06 For Sale, 338 WSM, 338 Ultra. Because of the 9.3 B&M these won't be going out anymore. Too big, too long. But have hunted a good bit with 338 caliber.
	.358! Got lot's of 358s. Like 358 better than 338. Had 35 Whelen-gone now, have 358 STAs, and 358 Utlras. Shot a hell of a lot of beasts with 358 STA in the day. Just excellent, again, 9.3 B&M being able to out perform it with the Raptors, and being so much smaller, these 358s will never see the field either.
	So there, those are my rat guns. They don't get a lot of attention unless I am testing something these days.
	I don't hunt deer and anything of that size I can use the 9.3 to better effect on anything, and the rifle is actually smaller and lighter than even the small bores, and far more effective. I am not much of one to shoot and have to follow a blood trail. I would just as soon put these smaller critters in the dirt right where they stand and be done with it. Following up these sort of things takes time away from doing real things! So not many small bores in my future, not in the field anyway!
	м
	Michael, It is funny that you brought up "rat" calibers. I have always went to a larger than needed calibers for the game that I'am hunting. For decades a 338WM or 350RM were my go to guns, even for whitetails. For elk, moose and bison 375 H&H, 375 Weatherby.
	A 9.3 B&M is going to be there replacement.
	I think if I was to minimize:
	257 Roberts for coyotes, wolves, bobcats, ground hogs 9.3 B&M for everything up to what I would need a 50, 500 B&M Colt 1911 45 ACP
	But I live in the U.S.A., no need to justify what and how many of any gun I own.
	Thank You to everyone that's helped keep it that way.

Your work in seeing the benefits of retained velocity in big bores made me think again how a ligh solid can do some good damage. Think of the hollow point ogive tip in a non functioning hollow p brass BBW 13 with a hole too small and too shallow to function as a Non Con but get there quick fast. Maximum penetration and velocity in a light bullet. Also the hollow point ogive tip in a coppe version BBW 13 with a slightly less depth round hole could act as a nice mono metal expanding v the expansion aiding qualities of that tip. Think of it as a higher retained velocity cup point solid. tipped copper cup point solid could expand at quite a low impact velocity and the added BC could some good functional expansion distance stretching. Maybe pure soft copper without alloy. A tipped copper without alloy. A tipped copper without alloy.	t fast oint c and r vith The I do oed

Think of the hollow point ogive tip in a non functioning hollow point brass BBW 13 with a hole too small and too shallow to function as a Non Con but get there quick and fast

OK, no matter how you cut it, it would not penetrate as deep as a BBW #13 Solid and would not produce as much trauma as a NonCon. It would be in effect a tipped cup point. Tip bullet would have to be seated deep, taking up case capacity. Now we have a shorter nose projection, proven not great for penetration as well. It would not shear, so would not produce as much trauma as a NonCon. Regardless of higher velocity because of these factors, shorter nose projection, cup point limited penetration, then it would be neither fish nor fowl.

quote:

a copper version BBW 13 with a slightly less depth round hole could act as a nice mono metal expanding with the expansion aiding qualities of that tip. Think of it as a higher retained velocity cup point solid

This concept has merit, and is proven effective, by the North Fork Expanding CPS, or CPES as I like to call it. However, for now I will hang with the North Fork CPES we have in .500 and .474 that have proven so effective.

Copper Raptors and big bores--nahhh, I still don't like the Raptors in the big bores much.

Raptors are better from medium down in my opinion.

Speaking of small bores and mediums again;

I stole this from someone this morning, blanked out the names to protect the innocent. LOL.....

## quote:

As I put the rifle, a loaner .375 H&H with 250 grains Barnes X-bullets on to the sticks the bull turn and faces us. As the bull advances towards us shaking his head back and forth, BLANK tells me to take him in the chest. My shot at 30 yards knocks the bull down but he gets right back up. As the bull staggers, I expect him to fall again, he doesn't. I shoot a second time, breaking his left shoulder. He walks away and I shoot again, behind the left shoulder, about 6" further back than I wanted to. The bull continues to walk away from us, stopping to **feed** a little. I shake my head not believing how tough these buffalo are.

We move our position and I shoot the buffalo for the fourth time, breaking his right shoulder. He refuses to go down so I put another bullet into his right shoulder. Still on his feet, the bull turn towards us, advances, and falls after a couple of steps. As we move to the side to finish the job, he somehow gets to his feet, trying to get to us. At the sixth shot, he again drops to never get up again. After the seventh and final shot the bull lets out three death bellows as his life ends.

Yeah Boy, I really want a 375 Now!

	On an expanding copper mono metal with a tip it would be more of a hollow point than a v cup Being heavier copper with a shorter hollow point ogive tip that desintegrates and aides expan- would be a hybrid between the TTSX and cup point expanding solid. I think it would be most id the larger bores in the 2.5 SD range at impact velocities under 2,700 fps. It could be good for la impact velocities for say muzzle loaders and moderate velocity hog thumping rounds. We are a great projectiles these days thanks to innovative bullet companies.	sion it eal in ower

	Max, I only wish I had tried the .395 Tatanka on that second cape buffalo in 2010	
	And if only the PH was willing to work a little harder on that second cape buffalo, instead of telling me: "Get ready, he is going to run through that little clearing over there (150 yards away), if you get	2
	shot, take it" I was fool enough to hastily follow instructions sigh	a
	So many rifles, so little time. That .395 was using 310-grain brass NonCons from S&H sigh Same ones that have killed well for you and me everytime we did our part.	
	Joking aside, so will a .375 with proper bullet at proper speed, in proper place.	
	They work well on things bigger than rats. Better than a 9.3!!! 😂

However, even then, you move up in caliber with the same superior bulletthis is where the big difference starts to show, in "Caliber" for buffalo. Going to .395 is a vast improvement I would venture, over .375. As I believe so is .416. And don't always listen to the PH! 150 yards is too far, and out of control for most chances of a second or third shot if things go wrong! As you already know! While I have not shot buffalo at 150 yards, I have listened to the PH at times when I KNEW BETTER, and damn it all, did it anyway, and guess what, it did exactly what I thought it would do, and then we had problems to sort out! Fortunately, we sorted them out, but at some point we must realize there are some things we know better than the PH does! Especially</pre>
