	Seasons First, I don't think there is anywhere close to enough testing with these new Handgun bullets to be able to make any determinations on anything, whether powder, weight, velocity or terminals. Right now, as far as I know every statement made thus far is pure Conjecture, with nothing to back it up? I have not even seen one yet, much less test terminal behavior. The only person I know of that is working much with them is Ken at CEB, which seems he is coming up with plenty of velocity to make the bullet work. How good it works in terminals is yet to be seen? How much velocity it needs to give terminal performance, remains to be seen? There are too many questions to answer before any determinations or opinions can be formed. quote:
	With revolvers especially as we go up in caliber the powder needs to burn in a smaller window of time and distance so we need the bore resistance to increase pressures to allow us to use powders that will give us the greatest velocity.
	By all means, I concur, the reason that with lighter bullets in my big bore rifles I don't use the slow powders that I use with the heavy bullets. All big bore rifles I have worked with react to this For instance lets take my own 500 MDM as an example When using 400-550 gr bullets I am working with slower powders like IMR 8208Still not a extremely slow powder but much slower than RL 7 and H-4198 when I drop to 300-350 gr bullets. I simply cannot get the velocity that is capable with the slower powder. Another big bore exampleS10 Wells Using RL 15 with 475gr to 600 gr bullets, absolutely a great powder, takes the heavies to full potential. But not the new 350 gr NonCon. RL 15 just does not do it there, a heavy dose of H-198 does it however. And there are many many more, in all big bore calibers that I have worked Light to HEavy with, and all the same story. So yes, if you go lighter for caliber then in a handgun or revolver, more than likely a move to a faster powder than normal should be the ticket for that application.
	quote: If we continue down this path of bands and fast burning shotgun powders it will not be feasible to work in the larger calibers .454, .475 .500 and .510.
	Why?
	Two things effect "Pressures" when it comes to absolute Bullet Design. Weight and bearing surface.
	More bearing surface does indeed increase pressure, less bearing surface indeed reduces pressure. When we first started working with the BBW#13s, Sam and I were using 8 + bands on both copper, and brass versions. We decided to reduce pressures by cutting the number of bands in half, 4 bands only.
	Using a 8 band 500 gr brass #13 Solid in my 50 B&M (.500 caliber) I was able to run the 8 bands at 2180 fps but at a cost of 67000+ PSI.
	The EXACT SAME BULLET With 4 bands reduced pressures to 60000 PSI, A 7000 PSI Decrease in Pressure, and velocity goes to 2195 fps NOT LESS VELOCITY BUT SLIGHTLY MORE VELOCITY at REDUCED PRESSURES!!!!!!!
	I then tested a copper #13 as well, also .500 caliber, 8 bands vs 4 bands, and got nearly the same results a 5000 PSI decrease and no decrease in velocity.
	Across the board the last few years the 4 band design of the current #13s have always without exception provided LESS PRESSURE, and more velocity than any other conventional full bearing surface bullet.
	I really can't see that changing just because the bullet is now in a handgun?
	quote:
	If we take a look at the "Punch" Bullets which are a brass bullet filled with a lead core,
	Yes, lets take a look at the Punch Bullet. I have worked with them in both .458 and .500 caliber, rifles of course. Do you view the Punch as a Trauma Inflicting Bullet Or a Deep Penetrating bullet? If I guess correct, you look at this as a penetrating bullet, that produces some trauma simply because of the Flat Meplat. Which would be the correct viewpoint. Now, you can in no way, compare the 150-200 gr .429 er .452 #13 Hollow Point NonCon to a Punch Bullet Solid Of course the Punch is going to drive deeper, no doubt. However, will that Punch Bullet Holl up to a Proper #13 Solid? I think things begin to change dramatically at this point.
	Example500 caliber Punch bullet 420 grs able to drive to 41 inches in my test medium at 1925 fps impact. Was not able to continue dead straight, but somewhat off course by 2 inches at the end of 41 total 375 gr North Fork New Nose Profile able to drive to 53-54 inches dead straight, yes, more velocity because of lighter weight Weight equal pressure and by proper nose profile and some added velocity was able to out perform heavier weight, at higher pressure, and lower velocity.
	I don't see this changing just because its in a handgun?
	No, I promise I am not being combative or any thing such What I want is to see the results of proper test work, and make determinations from said test work. Without the tests put in to see what is what, everything else is based on what has been done in the past, opinions, conjecture and what have you. Until it is tested and proven, then I don't see how you can, Whit can, or I can, say one way or the other regardless of experience. No one has real experience with this in handguns, handgun calibers and handgun cartridges. Before decisions can be made about bands, cavity depths, solids, powders, pressures or anything else, somebody has to do some test work This is all I am saying pure and simple. I may very well be wrong, things may in fact change when doing the handguns But I want to see real test work that can be documented before making those sort of determinations And it is not done yet
	Michael

18		Bullet technology gave us large meplats that have finally been co-opted by the rifle hunters! Big Grin Seriously, though, I think they need a little more	
-		weight and it will be a game changer.	
		Whit This is true, conversations I have had with you over the years, you have heard me credit the handgunners for being well ahead of the times with flat meplat builets that drive deep and straight! You have heard me say this many times. Rifle Shooters were WAY BEHIND the curve on this, some up on the African Forum Still AREI LOL	
		More Weight OK, first define type of bullet application!!!!!!	
		Trauma Inflicting Or Deep Penetration	
		Without doubt, the 150-200 Hollow Point NonCon is NOT going to penetrate as deep as any SOlidPunch, or Buster We must DEFINE PURPOSE OF SAID BULLET Because we are talking about two separate entities.	
		The 150-200 HP NoNCon should be compared to expanding conventionals	
		Then we talk about deep straight penetration in a total other conversation and purpose Buffalo for instance I don't want an expanding bullet for buffalo in the same sentence as HANDGUN	
		I see this as two totally different projects Same exactly as the rifle NonCon/Solid Two different purposes, two different jobs, not to be put together

Real	Trapper and th	the boys at CEB have been playing with that 250 gr #13 HP NonCon I had done some months ago . They have put it in the 458 Socom and are having some excellent this week they tested the bullet, as I ordered, running it at 2100 fps in the Socom with iliGun Getting excellent groups with it at 100 and 200 yds. A terminal test	
M.	showed that a	t 100 yds velocity was down to around 1700, and blades did not shear I think we talked about that earlier	
_	Trap put the cu	uts in the side, tested it yesterday Photos	
	a		
		photobucket	

This is a 200 Yard Group.....

Below is what Trapper sent to me this morning......

### quote:

Just finished up this am. Muzzle vel,2110fps,100yd vel 1710fps,awesome penetration of petals to 9 to 10 inches deep.no petals recovered, they blew out of the gel block, very violent impact..600° groups. 200yd vel 1415fps,awesome penetration of petals to 9° deep. 2 petals recovered, 1.5° group. 260yd vel 1292fps, no shear. I've got to say this is a very impressive bullet for the socom, a serious hog killer!!! I used BLANK of LiL gun, BLANK pistol primers, COAL 2.240°.

#### Michael

Troy is one of our wounded warriors and was being sent on his first Safari May 2013. He had decided because of recoil limitations that 338/06 would be just about right for his first Plains Game Safari i concurred with that. We struck up a deal for the rifle and he was one very happy individual.

Time was limited and also resources as we know like powder, primers and such, while we spoke about and worked some with the CEB Raptors, it ended up that there was just not enough resources, them where they needed to be. Troy had a very good load already with the 225 gr Barnes TSX, which I told him he would be just fine with that bullet.

He has returned now, he took 17 total animals with his Win M70 338/06 and the 225 Barnes TSX, there were no issues, and I think he only recovered 1 bullet, and it was picture perfect, although I do animal, and do not have a photo of it. Rifle was successful, bullet was successful, and Troy had the time of his life, and due to excellent shooting, Troy was successful in his mission....

Here is Troy and his Last Day Kudu......

of Us	📓 posted 05 June 2013 23:06 As most have noted our Terminal Tests here have really come to a halt the last few months, and with good reason, what is out there worth the effort, that we h	Hide Hide
) th	there, done it, already? Not very much, not in big bores, we have done it all, and if not, it ain't worth doing! Of course this is just my opinion.	
	But, when something a bit new comes along, and its not a rat caliber, we will take a look at it, as always. And we have something a bit new that I think should b to EVERYONE with a .458 caliber rifle, whether its a Socom, 45/70, 458 Win, Lott, or even bigger capacity. It is these two 250 gr NonCons from Cutting Edge Bulk	
I 0 .4	Lordered up the first one back last fall, or later maybe, but a simple 250 gr BBW #13 NonCon. And it works very well. So pleased I was, that we did the 225 gr # 416, and it is as good if not even better! These two bullets in 458 and 416 open up tremendous opportunities for anyone with either caliber, regardless of cartr emember, with a NonCon more is better, and there is NO UPPER END of velocity when in regard to Terminal Performance. In particular, for me, I wanted them so	13 NonCon in idge,
No Tr	versatility to my own B&M cartridges, and that is a tremendous success. Now, Dan and the boys at CEB have taken that and refined the design to work a bit better in the 458 Socom. For lack of a better name, currently, I call it the 250 Trapper was testing these last week or so, and they made a quick change in the bullet to get shear velocity down, and now have that shear at 1400 fps or sligh	) Socom. htly less A
	very positive move. The 250 #13 is at 1700 fps LVSP. Since the Socom is starting at 2100 fps, then this gives it a bit more range to get to 1400 fps.	
Th m lo	They sent enough for me to do some test work with, and I received those Monday. I have a lot of interest in this, since I am leaving in about 3 weeks for Africa, my 18 inch 458 B&Ms, and I am testing and working with the 250 #13 HP at 2900 fps, intending to see how this bullet does on wildebeat, zebra, and whatever ong enough! So I quickly yesterday loaded up the 250 Socom to check POI at 50, and it is in the same hole with the 250 #13, which I figured it would be. It do 25-30 fps slower than the same 250 #13. Neither here nor there it is of no consequence.	stands still
	was busting this morning to conduct a proper terminal test. But first, let me show you some differences in this bullet as opposed to the BBW#13.	
As di at	As you can see below, the 250 BBW #13 has 4 bands, standard issue, and the 250 Socom has 3 bands. I had to find out about pressure, if there would be any r difference, and there reality is not. In the 20 ind +658 B&M with 77/H-4198 the 250 #13 runs 2969 fps at 51315 PSI. The 250 Socom with the exact same load run at 52883 PSI. Maybe that one band less is giving slightly less pressure, but that would have to be determined over several more tests, as many times there is th difference hetween shots with the same load and builet So its really not determined on only one test.	ns 2945 fps
As di at di Yo	difference, and there really is not. In the 20 inch 458 B&M with 77/H-4198 the 250 #13 runs 2969 fps at 53151 PSI. The 250 Socom with the exact same load rur	ns 2945 fps hat much

Now, the cavity is also not our typical 6 blade cavity. The 250 Socom is a 4 Blade Cavity, round, with the saw cuts.... Blades are bigger and I think might penetrate some deeper in ballistic gel, and or animal tissue, however here in my test medium which is far denser than either, I saw little difference in the amount of penetration of the blades.

And now, how does all that come together?

	6/5/2013 250 Socom Talon Tip Muzzle Velocity 2886 fps 48 yd Impact Velocity 2837 fps Dades 6-7 Inches 2 20 Inches	
	48 yd Impact Blades 6-7 Inches X2 20 Inches	
	These are incredible bullets. I can tell you this today. If these 250 gr 458s, and the 225 gr 416s do as well as I believe they are going to do, and add as much these calibers as I suspect they will, I will NEVER as long as I am alive take to the field with another rat gun, or even medium bore, including my own 9.3 B&Ms. retired permanently, and I will carry nothing less than 416, even if all I am shooting is baboons and impalan

	Michael (the CEB folks and the entire list of people who have so generously worked n' shared their time n' knowledge with the CEB bullets) Thank you.	
	I first became aware of CEB from the G&A magazine article where the 165 gr copper solids were used on a water buffalo - and no immediate funeral service fol (Mar 2012? issue)! I ordered some for use in my 3 6.5x54MS Model 1903's. Haven't loaded them yet, but getting closer to doing so!	lowed
	I then learned of this Forum thread and began reading (I was much younger then!!), becoming a devout follower. I don't hunt as much as I use to, but greatly appreciate everyone's time n' efforts with the transitional development of the CEB's. Besides, "BIG is beautiful" when it comes to bore size!	
	This current development work with the .458 250 gr Socom has really gotten my attention - long being a .45-70 fan n' user.	
	best of regards to all, outsidebear	
	boom stick - do you have a .45-70 section out there? thanks outsidebear

	Michael,	
<b>W</b>	I wonder what the LVSP would be if the saw cuts went to the first groove. Where the wall thickness was a bit less. Have you tried the 250gr SOCOM in one of your old LOtts/24" ?

Rhodes One of Us		Hide Pos
one of os	Hi Michael,	I
	Can I ask your opinion on the shear of the petals of the 250gr noncon vs the 250gr socom.	
	You've carried out some pretty extensive testing on the noncons in both test medium and in heavy game so you know the shear and penetration of the: Even going to heavier petals on the medium bores to aid penetration.	se works well.
	With the socom having the cross cuts to initiate the shear at a lower velocity. Do you think the petals on these have the potention to "blow up" as it we skinned game and the petals not penetrate? If the petals break away earlier they may deflect before penetration? I suppose I am asking how far in doe begin with each of these styles of projectile.	
	I guess this could be adjusted with the diameter of the hollow and the depth of the cross cuts.	
	Cheers Rhodes

One of Us	Hi Rhodes	
	Yes, you bring up a valid point, one of which I had some concerns as well with the cuts or slits in the side.	
-lle	JD Jones has done a lot of work with these sort of bullets for the Whisper Cartridges, and sub sonic velocity. Same story, trying to get shear at extremel velocities. Some of the cuts they did are extreme, and so much so that running some of those at higher velocity the blades would actually shear before l target, but worked extremely well at sub sonic velocity. So, you have to be careful with this, you can get too much.	
	CEB, Trapper tested at 458 Socom velocity with this 250 Socom, great results in ballistic gel at low velocity, and normal Socom Velocity. I had some conce running at higher velocity, but the difference in these is the cut goes about 1/2 the depth of the cavity, while it gains us an extra 300 fps in Low Shear, i seem to change the dynamics of how it works, and at higher velocity impacts works the same as the normal #13 HP NonCon.	
	We must remember that my test medium here, wet print/magazines, is dense, and I say it is tougher, or more dense than animal tissue, or ballistic gel. will keep a check on potential issues better than most mediums because of this. A bullet gets no free ride here. From the test last week, the blades app exactly the same with the Socom as the #13 NonCon. Being 4 instead of 6 blades, they are larger blades. I think in animal tissue these larger blades	ear to shear
	slightly more than the 6 blades, but whether we can actually tell or not will be negligible somewhat, unless we start getting exits of blades on a regular one over the other.	basis with
	Shear begins with both Socom and #13 NonCon at 1.5-2 inches in either medium, gel or my mix here. It would seem that Dan and the boys at CEB got the cross cuts exactly right on this. Not too deep, and not too shallow

(A)	Sure is a little slow here on AR the last few days, even weeks Oh well What do you do? I keep shooting, and getting ready to go on a bullet testing mission in a couple of weeks. Everything is falling into place for that.	g/rifle testing
M.F.	North Fork is back in the US, has been for a couple of weeks. Spoke to John last week, and told me about their great experiences in Namibia. I forget ho animals they took, but it was a lot! Of course I believe they were using "North Fork" bullets 🤤 🛛	
	annials they took, but was a loci to tourse 1 believe they were using "Nutri for Donets	ompared to
	Our buddy Pagosawingnut returned, buffalo and a few other assorted critters, with 416 and 500 Nitro, #13s used, all successful. According to Rick, 416, NonCon, buffalo 50 yds, buffalo goes 10-15 yards piles up stone cold He can continue in more detail if he wishes	
	Our buddy LionHunter should be returning soon He and his SIL using 500 Nitros and 510/475 #13s, and also 458 B&M with some assorted ammo, and 250 #13 NonCon I sent him with? He is hunting with Karl in Namibia as well I think I saw Mike with a big ROAN And possibly 458 B&M But yet to b confirmed	
	Many others going to the field over the next few weeks, and months Hopefully we can get some reports on bullets, rifle, cartridge performance	
	My son Matthew returns today from a few days fishing in North Carolina He sent this to me last night, and if you know how big Matt is, then you can se are not minnows. I am not much of a fisherman, and I think I would have wanted a good large caliber bullet for these two	ee these fish

	Just back for 48 hours with 2 bull Ele, Hippo, Roan and Zebra. Still in recovery mode but Michael has asked that I post performance details.	
	These were the first two trophies taken with the new 250gr tipped BBW #13 from a 20" bbl 458B&M they worked fine on zebra and roan. Beau shot zeb yards quartering on through the left front shoulder and heart, coming to rest in the intestines; zebra kicked hind legs once and fell DRT. Roan was killed after I wounded him when the sticks collapsed in a burnt over area. Follow-up was easy due to blood loss. Roan found laying up and finished. Roan com officine 30 octooerd.	on follow-up
	African 29 category.	
	Two ele bulls were the first killed with the 510gr BBW#13 solids from 500NE DRs. Mine dropped to the shot on a side brain shot that went 1.5" high and Beau's was a going away side raking shot on a moving ele through the rib-cage and through the top of the lungs. Ele was dead 100 yards from the shot	t.
	Two ele bulls were the first killed with the 510gr BBW #13 solids from 500NE DRs. Mine dropped to the shot on a side brain shot that went 1.5" high and	t.
