### Terminal Bullet Performance

Well these are for the new 475 B&M Super Short! The 1.65 inch case, fits in Win M70 WSSM actions, 16 inch barrels, 6.25 lbs! With these bullets, the 475 Super Short should be as successful as the 50 B&M and the 458 B&M. These bullets should bring the cartridge to levels far beyond what would be normally possible.

Not only these, but North Fork is working on a solid and expanding cup point versions for the 475 Super Short as well.

Very possible these can also breath some new life into a lifeless caliber!!!!!!!

Also do take note, these are designed specifically for the 475 B&M Super Short, no compromise to fit in lever guns at all. Nose to mouth designed for bolt guns!

Michael

**michael458**

**30 April 2011, 17:00**

Yes, you heard me correctly above---I consider .474 caliber a lifeless caliber! Look at it, how many cartridges are out there in .474 caliber? 470 Nitro being most popular I would think, limited to doubles and singles. How about 470 Capstick? Dare say the most popular in bolt guns. Yes, a few more for sure, some much bigger in capacity, 470 Mobogo? Comes to mind. Probably best of show is Jeffes 470 AR, a truly capable cartridge and practical. But take a look at the bullet selection? What is available? 500 this and that, and that's about it. No heavier, no lighter for other uses. Just a stagnate caliber, same old same forever. Yes, there are those turnbull things too, which breaths some life in the lever guns. Still stagnate as far as I am concerned.

This is one reason I held off of doing a 475 B&M so long, I had ugly experiences with my Capsticks, bullet selection awful or lacking. Not even sure that I think .474 is a very capable caliber over anything else, 458 or .500 or .510. It might be because of the bullets available, or who knows, or it could be just my experience with the Capsticks that leads me to not be so impressed?

I have two rifles now, 475 Super Short and 475 B&M. No dies yet, so I have not started load development of course, but was not in much of a hurry as 500 gr bullets are too heavy to be optimum in the 475 B&M, and of course are out of the question for the Super Short version. But now, looking at these new CEB BBW#13s and matching NonCons, I am beginning to get a little excited about these cartridges and rifles. Like the 458 B&M the 475 B&M is going to be at it's best with 450 solids, and this matching 420 NonCon should be a hammer. Things are looking up for .474 caliber, no doubt about it.

Those .474 bullets will all work in the 470NE and will be great low recoil hunting bullets for thin skinned game. I'm sure those 420 non cons would be good for buffalo also.

Where is your mind this morning? 😊👉

Is it morning already

Got home a bit after 4 - days and nights don't mean much to me.

Trying to screw up enough energy and courage to trapse upstate to shoot the DR. I've "cranked up the volume" a bit with the these reloads and am interested in how they shoot out of my 13lb 600NE.

I must say Michael,you and Sam along with Dan at CEB have really **done good** with these #13s.

Hey, take the lighter 350/320 let them smoke through the 475 B&M for everything short of buffalo, then take the 450/420s when doing serious work.

I may end up liking these 475s?

M

**416Tanzan**

**30 April 2011, 22:31**

While talking about light bullets, some of you on this thread may help me with a load for my wife.

What would be a 'starting load' for a  
416 Rigby, Norma brass, Fed 215M primer  
Accurate 3100 powder  
and 300 grain Barnes TSX?

We will probably stick with the starting load.

We don't have a 338 anymore in Tanzania so the little lady is going to step up to a 416 Rigby.  
If the load only does 2500-2600 fps with 300 grains, that's fine.  
the important thing is a full-burning, safe, non-detonating load.

Why Acc 3100? Because we have quite a few surplus loads on site with that powder. We just need to open them up, remove powder and replace the bullet.

Thanks for help.

++ ++ ++ ++ ++

"A well-rounded hunting battery might include:  
500 AccRel Nyati, 416 Rigby or 416 Ruger, 375Ruger or 338WM, 308 or 270, 243, 223" --  
Conserving creation, hunting the harvest.

Boomy

I designed the .474s to work in the B&Ms. The nose is too long for turnbull in the lever guns. He will have to look elsewhere.

It will be interesting how the lighter bullets work in the doubles??? Sam and I will look at that after his busy season, and when I

return.

Glenn

As you can see from my shelves I am busy converting over to CEB and North Fork all the way. Seems the other stuff is just, "dated".

Been quite an evolution of sorts here the last 6 years. All my normal big bore rifles, 458 Lott, 458 Winchester, 470s, 416 Remingtons and Rigbys, 510 Wells, and who can recall what else, all of them, "Dinosaurs", extinct, put away. About the only use any of these get anymore is to do test work with, and of course to compare to the B&M rifles. Pretty easy for folks to make up their mind what they would rather carry when you hand them one dinosaur, and a B&M. The dinosaur gets put away pretty quickly.

Talk about evolution of bullets--It's all right here in these 155 pages! Jesus, I only thought I knew something when we started this thread, been a hell of a learning experience, and we are not finished yet! Lot's of work left to do!

Yes, I think "Evolution" would be the proper term!

**01 May 2011, 03:34**

Just returned from the Warwarsing area of Upstate NY. Took my 9 year old daughter, a Remington Nylon 66 Mohawk (that is my brother's from chillhood), my svelt V-C 600 and a variety of loads topped by CEB #13s.

She shot a smiley face of 8 shots (cool, I thought) in the bullseye and then threw another 100 rounds mostly into the red.

I learned that the 900 grain CEB #13s don't care what the velocity is, they shoot into 1.25" at 75 yards whether velocity is 1915fps or 2,113fps.

Also learned that some old WR 600NE shells with very round-tipped 900 grain solids I bought from Corbin average 2,011fps over the Oehler 35P. They too shot into less than 1.5" at 75 yards.

Best part was seeing my daughter enjoy herself and then go exploring throuh the woods overturning rocks and fallen trees in search of crawling things. Found plenty but no snakes (her favorite) unfortunately.

I'll put this on the DR Forum too ...

Most definitely "Evolution" is the proper term! Much work has been accomplished in these 155 pages in slightly less than 18-months. What pray tell will the next 18-months will bring?

It will be most difficult to improve upon the nose profile of the BBW #13 bullets. The solids are pretty well settled based upon whether the bullet is destined for a bolt gun or DR. Perhaps further tweaking of the driving bands? Perhaps the NonCons can be further tweaked here and there to maximize their performance when the synthetic spitzer nose inserts become available and their impact upon petal separation is factored in.

And what changes will NF, S&H, and GSC bring us?

Jim

John Wayne

**boom stick**

**01 May 2011, 04:06**

The bullets seem about perfect. I think a four petal non con would be worth a test or two. It seems to shear 4 petals over 6 might be better for lower velocities along with an outer v shaped sheer ring.

Sam

Yes it does and I hope to do just that!

Recoil - well it was more but then again, 2 pounds lighter **plus** a 900 grain bullet going 300fps faster than the last time ...

Not sure which contributed more but either way it wasn't bad after 10 rounds and barrels too hot to hold. 🤔

My only disappointment occurred when a branch fell out of a tree right onto the double - leaving three nearly parallel scratches in the stock. 🤔

Extremely good news to hear! Pick the load--hopefully some more test work on my end will help you decide what velocity is optimum, and you are RTG (Ready To Go). Excellent.

quote:

My only disappointment occurred when a branch fell out of a tree right onto the double - leaving three nearly parallel scratches in the stock. Mad

I told you that you would shoot the tree down with the 900 BBW#13s, try to get out of the way before it falls next time-- 😊  
Sorry about the scratch on the rifle, but at least it's not "NIB" anymore, and you are adding character!

quote:

Perhaps the NonCons can be further tweaked here and there to maximize their performance when the synthetic spitzer nose inserts become available and their impact upon petal separation is factored in.

Jimmy  
AN area I am interested in for sure. I don't know what the next 18 months might bring us? But the work will not cease. Now the next 4-5 months are going to be extremely interesting to me because of the field work that is getting ready to start. In fact, my buddy is in Namibia right now for several variety of plains game. He has nothing with him except his 416 B&M and the 325 BBW#13 NonCons at 2530 fps. I will start getting reports from him soon on this, he has my sat phone and is supposed to keep me updated. So it's getting ready to start rolling in, "Field Reports"

Another that I think is either there, on the way, or close to leaving is our test bud Mike. He is on buffalo again I believe so field reports hopefully will be coming back soon on his work.

Many others are going to be in the field soon as well. Myself included on a major mission. Of course testing all we have so far. One that I am very interested in looking at is the deep cavity lion bullet on some thin skinned game, as opposed to the normal cavity. Trauma inflicted, and the dispersal of blades within the body cavity on larger animals, wildebeast and such.

Lot's of things to investigate left.

Isn't that the truth?

When it happened, not a peep - had to take the high road as an example for my daughter's sake and my blood pressure. Put everything away and the "adventure" as my daughter calls any exploration through any patch of woods, began.

I'll simply make up a good story about it ...

"I was thankful for the quality of the wood and weight of the gun as I hefted it high above the ancient bosses and swung mightily for the base of the skull as the Cape buffalo charged ... He hadc hosen a good way to die ..."

Next up will be a thorough thrashing of the Non-Cons. On the drive back home, I thought about the Non-Cons and vaguely remembered some rule about such design and NJ law ...

**THAT** tree has a nice cantaloupe-sized hole in the middle. The tree responsible had a long-dead limb caught up in its branches and either the wind, my "wind" or the concussion from the 600 brought it down upon the double as it lay on its open case when my daughter and I walked up to see the target.

Take note this is the flat nose HP 6 bladed version made for the 45/70. These are older and not TSX. Not sure if they are making TSX in this for the 45/70 or if it is still without bands? I have not bought any in years for this. The 458 B&M has taken place of nearly all .458 caliber guns.

I must edit. These are older X versions I am pretty sure, I don't think these are TSX. I have TSX on the shelves however.

I have an excellent attitude towards the Non Cons, including Barnes. If the petals hang on, fine, if they shed, fine, either way, superb performance and I see no down side either way.

I have TSX on the shelves, but thanks. It's a mainstay and will be excellent for the upcoming 458 Super Short. Also I have some of the new 300 gr blue tipped TSX delivered today, along with a new silver ballistic tip 300 gr 458. We will test next week both of these, and maybe I throw in some 300 TSX in the lott and 458 B&M for retest.

Michael

Checking back in the thread I found sound 300 grainers in .458" that seemed to penetrate pretty well. Does anyone remember or know if the blue-Tipped TSX 458 "SOCOM" has been tested here?

I just checked inventory--I have a box of these. Can't recall why exactly, and I don't recall ever loading any or testing them. I will see if I can get that worked into the upcoming schedule, if I don't forget! 🍷

Thanks. It would be good to know it's length. And I thought that it might prove useful as Sam or Cutting Edge consider polymer tips on the non-cons.

Jim, I, and maybe a few others like to dream about 'reaching out and touching a critter--hard'.

One incongruity remains on this 300 grain blue-tip. The BC is published as .236. That is almost certainly a mistake. Their flat-base hollow-point with a significant meplat is listed as .234 BC. There is no way that a boattail and smooth-tipped bullet is going to remain about the same.

anyway, cutting edge can come up with a nice BC design for the non-cons. There is no need to keep a 13 degree angle on the hollow point, the meplat and angle only play a role for the solids. The hollow-points expand and explode, so they can be put into whatever is the most aerodynamic.

my two shillings.

Hi All,  
I'm looking forward to the reduced load 600OK tests.  
There is a fair chance that I can use the information from it to judge these shotgun slugs.  
<http://www.europeancartridgeun...d.com/en/uslug.html>

62 caliber 570 700 and 900 grains

Are you even allowed to use a smooth bore shotgun for DG?

Cheers, John

A lot of locals have been boiling up birdshot and re-filling and sealing shotshells for a century with some success. They can get into big trouble, though, when they mess with ele's.

All my information is heresay, though, since we made sure that former practitioners got ahold of accurate rifles with good ammunition when we hunted together.

Lefteris,

Most interesting...these brass bullet sabots with their 81% Meplat should work nicely. Will these sabots work properly through Paradox 12 gauge rifled barrels?

Jim 🤔

Jim,  
Yes, they will work but a better solution for fully rifled barrels is the US 900 (same slug without the stabilising basewad) that permits more powder volume and higher velocity (1400 to 1500f/s) from 12ga shotguns with 3.5" chambers.
